10 **Abstract**

11 ICT-based learning media support the mathematics learning process during the COVID-19 pandemic.
12 This development research aims to design android-based learning media on valid trigonometric
13 material and improve students' mathematical critical thinking skills. This development research using
14 the ADDIE model took 20 students (limited trial), 50 students (extensive test), and 26 students
15 (product trial) as subjects. The results showed that the developed android-based learning media was
16 valid and could be used without revision with a combined percentage of 87.33%, with details of
17 material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. The
18 results of the practicality test on students of 81% showed that the Android-based learning media
19 design had a strong response, so the learning media made were very practical to use. The product test
20 results show that the achievement of mathematical critical thinking skills of students who learn to use
21 android-based learning media is better than those who learn not to use android-based learning media.

22 **1 Introduction**

23 The COVID-19 pandemic has forced the world of education to make maximum use of technology in
24 the delayed learning process. Learning in mathematics that utilizes technological advances in the
25 form of online learning can facilitate teachers and students simultaneously in delivering and
26 obtaining subject matter (Bertram, 2020; Chai et al., 2013; Mahmud et al., 2022; Reddy et al., 2021;
27 Su et al., 2022). One of the uses of online learning media that is currently in great demand by various
28 groups is the use of Android on smartphones (mobile). The development of information technology
29 has now been used in various schools to implement interactive learning media based on Android
30 using a PC or smartphone.

31 The use of Android as a learning medium gets a positive response from various groups and also
32 provides some convenience in the online learning process. Churiyah et al. (2020) recommend that
33 there are several conveniences in android-based online learning, including for teachers that student
34 learning outcomes can be known directly, learning activities are not limited to distance, time, and

place, in the learning process, students can be accompanied by parents, students can access the network with the internet, students can take advantage of the media in their surrounding environment and have a lot of time with family. Irfan and Wulandari (2019) stated that on Android-based learning media, students can learn more easily without being limited by time and place, nor do they need to carry books. The development of learning media at this time has utilized multimedia elements that are packaged in the form of an Android application so that it can reduce student boredom in learning. However, the obstacles that often arise are not only from student factors but also from teachers and media or teaching materials that play an important role in the mastery of understanding students' prerequisite materials (Hidayat et al., 2022; Pertiwi et al., 2021; Rohaeti et al., 2019; Sulistyo & Kurniawan, 2020; Tran et al., 2020; Wijaya et al., 2020).

In addition to the benefits that are a positive impact of using Android, there are also some negative impacts that arise, including that there are still many students who do not focus on learning because they are too busy with their cellphones used for social media and also playing games (Irfan & Wulandari, 2019). In addition, there are also some groups who still have difficulty getting internet access, and there are also families who do not have mobile devices. However, the positive impacts are far greater than the negative impacts. The government has also taken measures to minimize the negative impact by providing study quota assistance and creating study groups so that students who do not yet have devices can still study by joining with friends who have mobile devices.

Android-based learning media uses cellphones as a tool to facilitate effective and efficient learning so that students may learn (Martono & Nurhayati, 2014; Novaliendry et al., 2020). This is due to the Linux-based Android operating system for mobile devices, including smartphones and tablet computers, which Google and the Open Handset Alliance developed. Android is intended to be an operating system that offers developers an open-source platform to build applications (Hakky et al., 2018; Irfan & Wulandari, 2019; Sari & Wati, 2020). Since smartphones and tablets may be used as learning aids anytime, anywhere, and with a high level of practicality, attractiveness, efficacy, and efficiency, android-based learning media is a learning medium.

Irfan and Wulandari (2019) note that the eligibility criteria for android-based learning media are categorized into two aspects, namely content or material aspects and media aspects. Aspects of the material can be viewed in terms of suitability, quality of content and objectives, and instructional quality. The media aspect can be viewed in terms of ease of use and navigation, in terms of aesthetics or beauty, in terms of media integration, and in terms of technical quality. While the criteria for android learning media, according to Sari and Wati (2020), are carried out based on student questionnaires with several aspects as follows: (1) Practical aspects; (2) Aspects of visual appearance; (3) language aspect; and (4) Aspects of effects for learning strategies. Meanwhile, according to Hakky et al. (2018), the eligibility criteria for android-based learning media are divided into two, namely material assessment and media assessment. The assessment of a piece of content takes into some factors, including: (1) the relevance of the content; (2) the structure of the content; (3) the evaluation and practice questions; (4) the linguistic element; (5) the effects on learning techniques; and (6) the visual appeal. The media evaluation also takes into account: (1) language features; (2) effects on learning techniques; (3) factors of software engineering; and (4) aspects of aesthetic appeal. While evaluating student responses, considerations for both learning methodologies and visual appeal are taken into account.

The eligibility criteria for the Android-based learning media used are similar, then the researchers used three criteria: material criteria, media criteria, and student response questionnaires. The material assessment criteria are divided into several categories: (1) the material's relevance; (2) its

organization; (3) evaluation and practice questions; (4) the language aspect; (5) the effects on learning strategies; and (6) its visual appearance. Language aspects, effects for learning strategies, software engineering aspects, and visual appearance aspects are all included in media evaluation. The following topics are covered in student response questionnaires: (1) practical aspects, (2) visual appearance aspects, (3) language aspects, and (4) effects on learning strategies.

Trigonometry is one of the mathematical topics that can help you develop more mathematical skills (Basir & Maharani, 2018; Wijaya et al., 2020). Furthermore, trigonometrical material is used in many other fields of science, such as architecture, navigation, engineering, studying the motion of celestial bodies such as the sun, moon, and stars and their calculations, and several other branches of physics (Basir & Maharani, 2018; Purwanti, 2017). There are so many roles for this trigonometry material that it is critical that students understand it at the high school level and even higher, namely in college, where trigonometry material appears frequently and becomes one of the requirements for graduation.

Trigonometry's importance is still not balanced with students' mathematical critical thinking skills. Higher-order thinking skills in mathematics are expected to be important learning outcomes (Abdullah et al., 2016; Hendriana et al., 2022; Kurniati et al., 2015; Lewis & Smith, 1993; Zetriuslita & Ariawan, 2021). The ability to solve non-routine problems is defined as critical thinking (Kurniati & As'ari, 2019; Mogari & Chirove, 2017; Sari & Hidayat, 2019). Thus, critical thinking skills can be defined as logical thinking that is reasoned and focused on solving mathematical problems (Lewis & Smith, 1993; Paul & Elder, 2019; Widyatiningtyas et al., 2015). Thus, mathematical critical thinking ability is a systematic ability that can be used to solve mathematical problems by combining prior knowledge with mathematical reasoning abilities.

However, in reality, mathematics learning activities in Indonesia have not fully trained students' critical thinking skills. This can be proven from several times the results of the Trends in International Mathematics and Science Study (TIMSS) with high-level cognitive questions that measure critical thinking skills. In the 2015 TIMSS, Indonesia was ranked 46th out of 51 countries with a score of 397 (Safari, 2021). Then in the 2018 Program for International Student Assessment (PISA) results, it shows that Indonesia's achievement in mathematics has a score of 379 which indicates a decrease of 7 points from that obtained in 2015 (Setiawan et al., 2021). This concludes that the improvement of students' mathematical critical thinking skills still needs to be improved.

Aside from the above study, the authors want to see how much Android-based trigonometry learning media is expected to improve students' mathematical critical thinking skills during the COVID-19 pandemic. The purpose of this study is to analyze and investigate: (1) the development of android-based learning media on trigonometry materials; and (2) the outcomes of implementing android-based trigonometry learning to improve students' mathematical critical thinking skills.

2 Research Methods

The ADDIE (Analysis, Design, Development, Implementation, and Evaluation) model is used in this development research to create android-based learning media on trigonometry material to improve students' mathematical critical thinking skills during the COVID-19 pandemic. Figure 1 depicts the stages of the ADDIE development model.

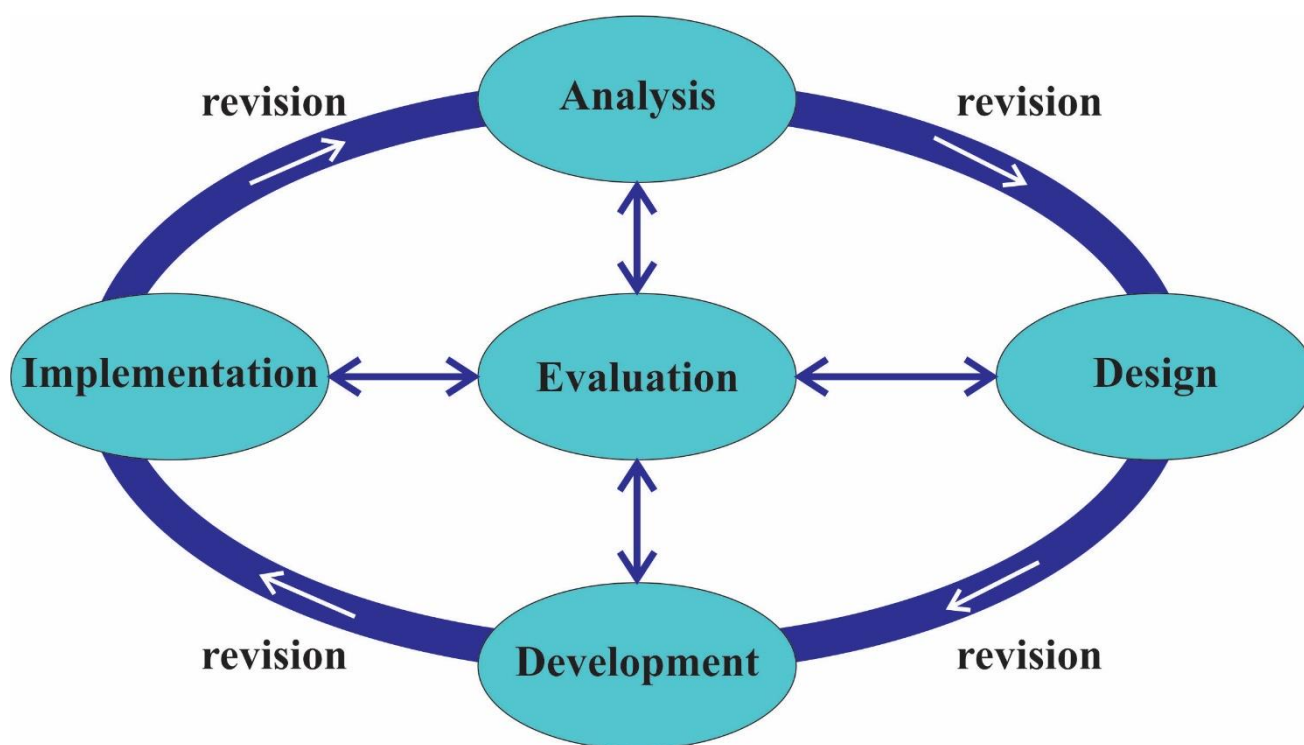

Figure 1. ADDIE development model

2.1 Analysis Stage

The analysis is performed to determine the learning needs and competencies that students must master. Details of activities during the analysis stage, specifically:

- a. A user needs analysis is a study that is conducted to determine what is required in the development of learning media. The information was gathered through interviews with the goal of eliciting information about problems encountered while learning trigonometry material.
- b. Identification of needs (problems) seeks to discover the solutions that must be proposed in the design of android-based learning media in order for students to master the competencies required.

2.2 Design Stage

This stage's activities are divided into five steps, which are as follows:

- a. Developing competencies, namely developing specific competencies that students must achieve in designing android-based learning media, so that students can be self-sufficient (mathematical critical thinking skills).
- b. Determine the learning material, which is trigonometry in class X SMA. This material was chosen to keep the discussion from becoming too broad.
- c. The researcher creates an android-based learning media strategy to aid the learning process and ensure that the predetermined competency goals are met. This product contains at least three media that are combined into one, namely a Google Form, a Wizer.me interactive worksheet, and an Apperception video.
- d. Evaluation, specifically evaluating the equipment and conditions required by students in order to achieve the learning competencies that are expected.

- 144 e. Sources, specifically locating and determining learning resources that can aid in the creation of
145 this android.

146 2.3 Development Stage

147 The development stage consists of producing or creating specifications for android-based learning
148 media that were determined during the design stage. The android-based learning media must then be
149 validated before being used in the learning process once it has been completed in production.
150 Activities carried out during the development stage include:

- 151 a. Creating learning media, specifically Android-based learning media Android-based learning
152 media is created with the PowerPoint application, which is easily accessible on a laptop.
153 Furthermore, it is converted into an application using APK Builder Pro 3.4, so that it becomes a
154 product in.html and is ready to be explored into an application that is ready to be installed.
155 making android-based learning media that is scientifically tailored to the needs of students
156 learning trigonometry material.
157 b. Validation of Learning Media, which includes expert, user, and audience validation in the form
158 of a questionnaire the validation of learning media. This validation is intended to gather
159 feedback for revising android-based learning media so that it can be said to be usable.

160 In this case, expert validation is performed by a single lecturer who is both a material expert and a
161 media expert. Mathematics teachers perform user validation, and students are tested for audience
162 validation. The validated criteria for assessment aspects include:

- 163 a. Material expert assessment: (1) aspects of material relevance; (2) aspects of material
164 organization; (3) aspects of evaluation and practice questions; (4) language aspects; (5) effects
165 of learning strategies; and (6) visual appearance.
166 b. Evaluation of media experts: (1) language aspects; (2) effects on learning strategies aspects; (3)
167 software engineering aspects; and (4) visual appearance aspects.
168 c. User evaluation: (1) aspects of material relevance; (2) aspects of the material organization; (3)
169 aspects of evaluation and practice questions; (4) language aspect; (5) effects for learning
170 strategies; and (6) visual appearance.
171 d. A student response questionnaire with three sections: (1) language aspects, (2) effects for
172 learning strategies, and (3) visual appearance aspects.

173 2.4 Implementation Stage

174 The implementation stage is the stage in which the mathematics teacher delivers learning material in
175 the classroom. Material is submitted using android-based learning media that has been validated by
176 experts, as well as a control class that does not receive media as a benchmark for evaluating material
177 for the experimental class.

178 2.5 Evaluation Stage

179 The evaluation was carried out to determine the quality of the finished products, which were android-
180 based learning media. This level of quality will be evident if android-based learning media can
181 improve students' mathematical critical thinking skills both before and after learning. In this step, the
182 researcher classified the data to improve students' mathematical critical thinking skills, which would
183 be measured using test questions administered at the beginning and end of the lesson. If students'
184 mathematical critical thinking skills improve, learning with android-based learning media is

considered successful; however, if there is no improvement or a decrease, the developed android-based learning media must be improved. Figure 2 depicts the entire flow of research and development activities.

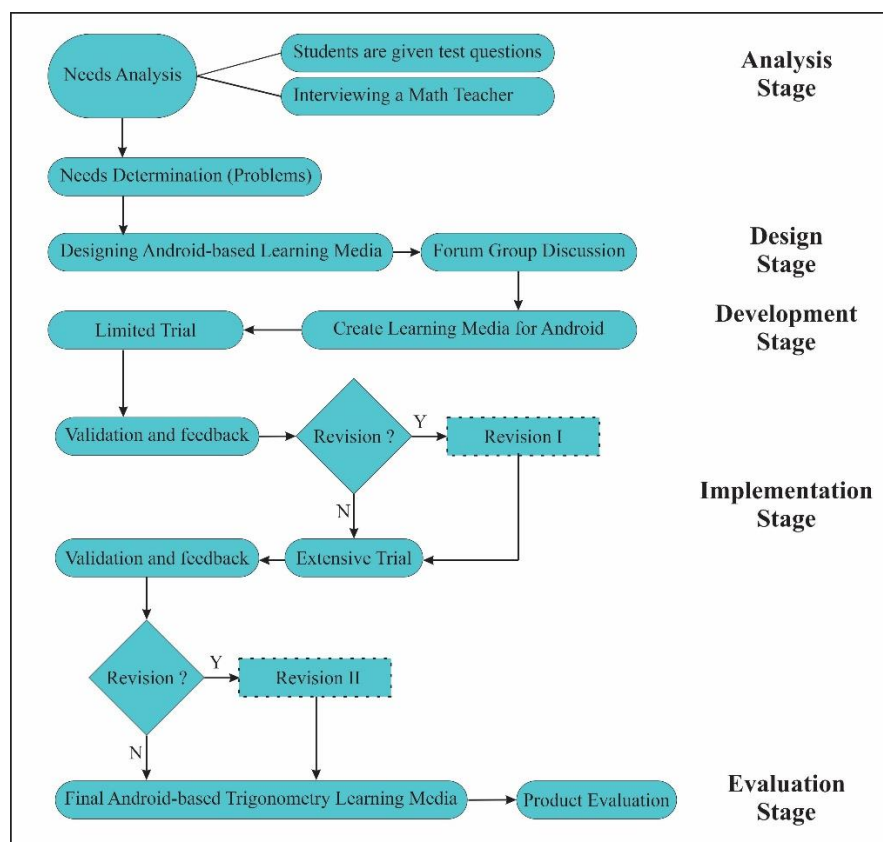

Figure 2. Flow of research and development activities

3 Results

This development produced learning media in the form of Android applications based on Trigonometry material. The resulting application is a file with an.apk extension that is installed on an Android smartphone. PowerPoint is used as a medium for application development, which is then exported into an application using Website 2 APK Builder Pro 3.4. It also makes use of several supporting applications, such as g-form, interactive worksheets, and interactive videos, to create self-contained applications that teachers, students, and parents can easily control. The outcomes of the development stages used in the ADDIE development model (Analysis, Design, Development, Implementation, and Evaluation).

3.1 Analysis Stage

The following steps are required to determine the initial needs for developing learning media: (1) User Needs Analysis, (2) Student Learning Style Analysis, and (3) Curriculum or Content Analysis. Before moving on to the user requirements analysis stage, the problem is identified and the required solution is determined. Based on observations of classroom learning, student interviews, discussions with mathematics teachers, and readings from various articles, problems were identified, including students' basic mathematical abilities and lack of interest. This is caused by a number of things, including the lack of independent learning media, a lack of innovation and variety in the use of

207 media, and a lack of use of Android devices as learning tools. Making learning media can be used to
 208 solve previous issues.

209 The need for the product is determined by analyzing user needs. Table 1 shows the data from
 210 observations and interviews used to determine needs.

211 **Table 1.** Observational and interview-based data

Evidenced	Analysis Findings
Examined subjects	Trigonometry
The learning procedure	Describe with examples, practice, and homework
Books or other educational resources are accessible.	Some textbooks can only be used at school; however, due to limited availability, not everyone can borrow textbooks from school.
The caliber of learning media	Still limited to powerpoint slides, which are rarely used. Furthermore, the media has not changed.
Student Situation	Difficulty understanding the material and requiring the teacher to explain it repeatedly; difficulty finding reference sources; and difficulty completing assignments
Teacher limitations in the classroom	Due to the perceived difficulty of the material, the inability of students to interact face-to-face due to the pandemic, and the short study periods at school, students lack the motivation to learn.
Students' technology as a source of independent learning	Some students have computers, but many more have Android smartphones that are underutilized.
Required media	Attendance, materials, videos to clarify the material, examples, and practice questions with discussion, as well as media that can be used for learning at home, are examples of media that can attract students' interest and attention.

212 The findings of the observations and interviews are then analyzed to determine user needs, which are
 213 supported by the specifications/features of learning media (see Table 2).

214 **Table 2.** Results of user need analysis

Requirement	Analysis Findings
User Aims	SMA/MA/SMK students in Class X

Requirement	Analysis Findings
Learning Media Categories	Trigonometry learning media takes the form of an app that can be downloaded and installed on an Android smartphone for independent study.
Features that are required	1. Instructions for use 2. Contains fundamental competencies and learning objectives 3. There is an email-synchronized attendance list link (g-from) 4. Displaying materials and examples 5. Available instructional videos (edpuzels) 6. There are practice questions and discussions (wizer.me) 7. Developers' page for applications.

215 The analysis results related to the required features and content (see Table 2) must have the
 216 characteristics of learning media to produce a good display. This media development incorporates
 217 Alessi and Trollip's (Alessi & Trollip, 2000) media characteristics, namely: (a) introduction to
 218 learning media; (b) student control; (c) consistency; and (d) presentation mode. The start page in the
 219 form of the media title and developer identity marks the beginning. A login button is presented so
 220 that users can proceed to the next page. Student control allows users to interact with learning media.
 221 Control is accomplished through the use of specific buttons, namely menu and navigation buttons. In
 222 learning media, menu buttons include buttons for various menu options. Navigation buttons are used
 223 to move to specific pages, such as (1) Home, which takes you to the main page of learning media, (2)
 224 Next, which takes you to the next page, and (3) Back, which takes you back to the previous page.
 225 The goal of consistency is to make learning media more convenient for users. The following
 226 components have consistency applied to them: (1) putting the home, next, and back buttons at the
 227 bottom; (2) using consistent keys for the same purpose; (3) using consistent paragraphs, font sizes,
 228 and font types in the text; and (4) using a consistent color for one-way sections. while the
 229 presentation mode depicts the presentation of content in accordance with the requirements of visual
 230 elements, namely: 1) readability of media text, where learning is developed using clear and easy-to-
 231 read text. The font used is Maiandra GD, which is a suitable size and easy to read. Furthermore, the
 232 text color is adjusted to match the background color so that the text is legible. 2) Graphic quality is
 233 used in a display that is arranged with artistic quality and attractiveness. A good color element is
 234 presented with a maximum of five color shades. 3) Video quality The video in this lesson is used to
 235 visualize the material through various examples from everyday life.

236 The next step is to analyze student learning styles after identifying user needs. This analysis is useful
 237 in determining what type of media will be created to suit students' learning styles in order to improve
 238 students' learning motivation. Table 3 shows the results of the analysis of student learning styles.

239 **Table 3.** Analysis of student learning styles

Analysis Findings
Students prefer to learn in a relaxed and enjoyable environment, free of stress, with opportunities for observation, practice, and discussion.

Analysis Findings

To discover the benefits of everyday learning, it is necessary to alternate between calculations and practice.

Use of educational games to assess practice questions

At the curriculum analysis or content stage, namely material relevant to the specified basic competencies. According to the syllabus, basic competencies and objectives/indicators are required for developing trigonometry learning media. Angle measures and trigonometric ratios, trigonometric ratios of special angles, graphs of trigonometric functions, rules of sin, cos, and area of triangles, and functions of trigonometric equations are all organized around these fundamental competencies. At this stage, the material compiled is guided by a variety of sources, including books, modules, and other supporting materials.

Other content that will be included in the learning media, such as videos, examples, and practice questions, must be determined in advance, in addition to the material. The videos created in this application are in the form of light videos at the beginning of learning that contains illustrations and examples of the application of trigonometry material to daily activities, and several videos are also given as examples of problem-solving. Practice questions are presented in wizer.me interactive worksheets to facilitate student work and teacher correction, and can be emailed to parents.

3.2 Design Stage

The design phase produces a flowchart that describes the sequence and structure of learning media, a storyboard with a template design plan, and an interface design. The created flowchart is then used as a guide for designing storyboards, resulting in a planning design that is in accordance with the media structure (see Figure 3).

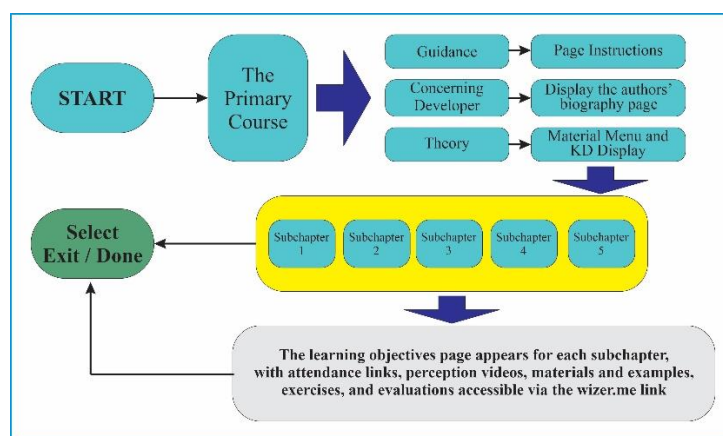

Figure 3. Flowchart of media structure

The storyboard is a rough outline of the display of the learning media that will be created, including the media's content, layout, and the majority of the elements that will be included (Herbst et al., 2014; Jones, 2008; Webel & Conner, 2017). The story-board is then used as a guide in creating the interface design. The interface design creates a real storyboard representation by paying attention to the previously analyzed elements and characteristics of the learning media, such as balance, color, text, graphics, and others (see Figure 4).

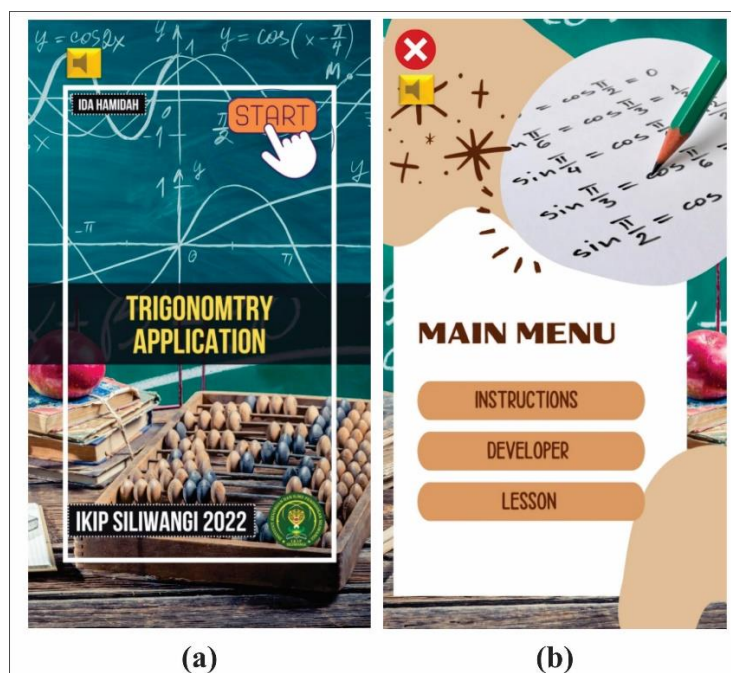

Figure 4. Interface design a) homepage and b) default menu page

The storyboard design is then translated into a real display or interface design to make it more appealing and user-friendly (see Figure 4). Furthermore, each resource includes information on learning objectives and attendance links (see Figure 5).

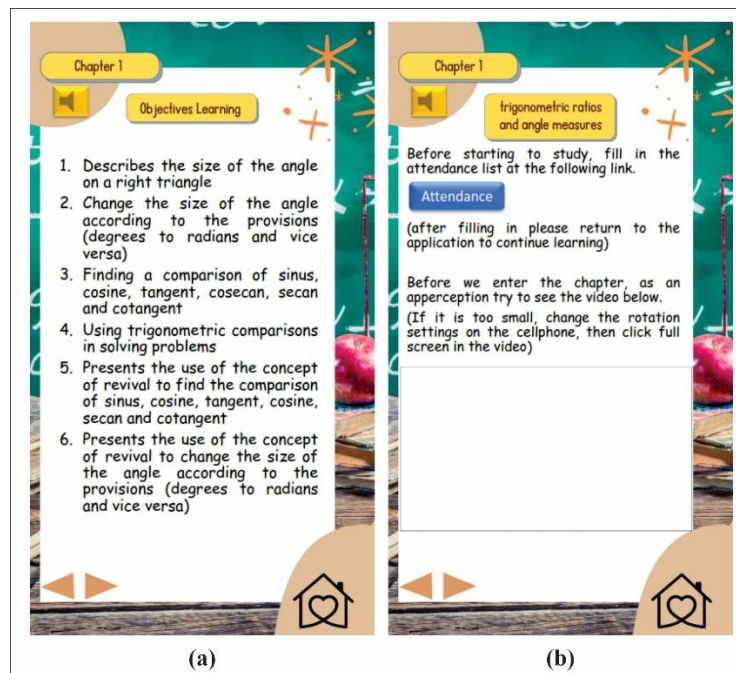

Figure 5. Interface design a) learning goals and b) attendance links

Exercises are also presented as a worksheet on each material page (see Figure 6). It is intended to continue to hone students' mathematical critical thinking abilities.

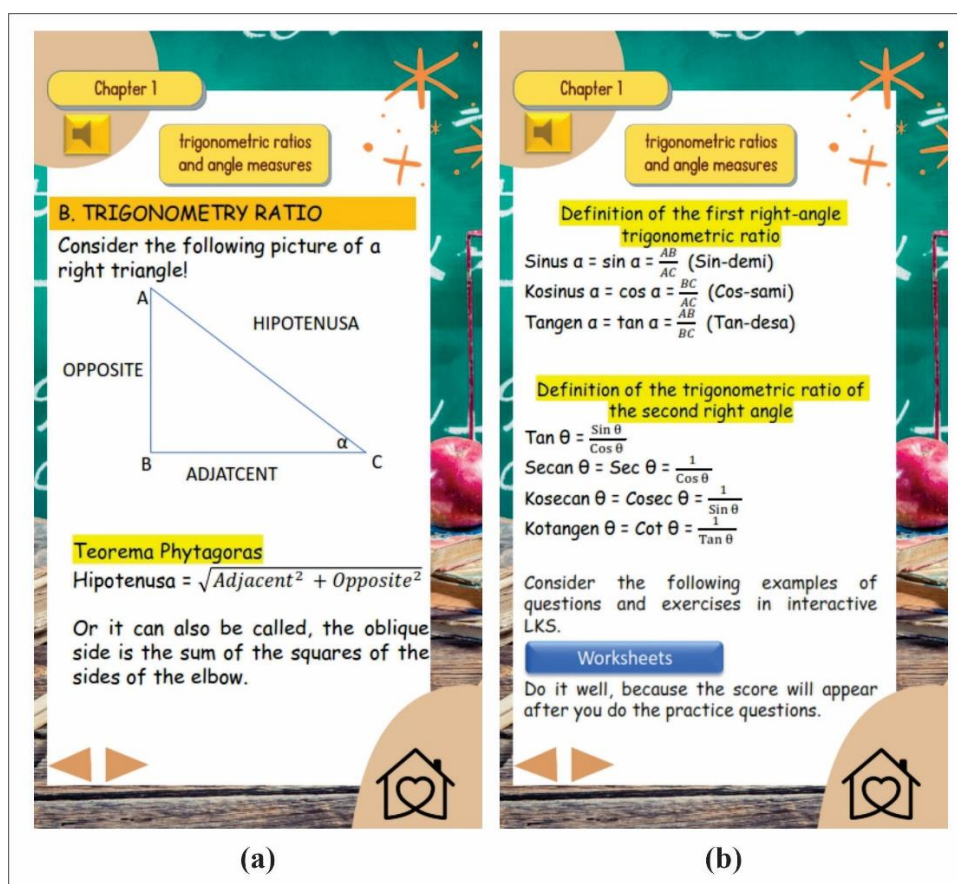

Figure 6. Worksheets and resource pages

3.3 Development Stage

Development is the stage of product development and testing in which the results of the analysis, and design are transformed into a complete finished product and validated by experts, specifically material and media experts. In addition to validation, the developer requests feedback and suggestions from expert validators in order to improve the developed media.

3.3.1 Making Educational Media

This android-based learning media is created in PowerPoint, which is then converted into an html file product by APK Builder Pro 3.4 and is ready to be explored into an application that is ready to be installed.

3.3.2 Learning Media Validation

Experts validate learning media (material experts, media experts, and users). Dr. Sri Adi Widodo, M.Pd. is the material's validator (Lecturer of Mathematics Education, Universitas Sarjanawiyata Tamansiswa Yogyakarta, Indonesia). Table 4 shows the results of material validation.

293 **Table 4.** Material experts' validation results are recapitulated

Indicator	Score	Levels of Validation
Language Aspect Eligibility Evaluation	100%	Extremely valid
Evaluation of Learning Strategies	85%	Extremely valid
Visual Evaluation	84%	Valid
Material Relevance Aspects Assessment	80%	Valid
Aspects of Organizing Materials Evaluation	79%	Valid
Assessment Aspect Evaluation / Practice Questions	75%	Valid
TOTAL	84%	Valid

294

295 Dr. Surya Amami Pramuditya, M.Sc. is the media's, validator the media. He is the Head of Media
 296 and Learning Device Development at Indonesia's Gunung Jati Swadaya University. Table 5
 297 summarizes the media expert validation results.

298 **Table 5.** Expert validation results recapitulated

Indicator	Score	Levels of Validation
Language Aspect Eligibility Evaluation	100%	Extremely valid
Evaluation of Learning Strategies	90%	Extremely valid
The aspect of software development	92%	Extremely valid
Visual Evaluation	84%	Valid
TOTAL	92%	Extremely valid

299

300 Users validate the development of learning media, in addition to material experts and media experts.
 301 Agie Ginanjar, S.Pd., is a mathematics teacher at SMA Negeri 2 Padalarang in West Bandung,
 302 Indonesia. Table 6 summarizes user validation results.

Table 6. Recapitulation of math users'/teachers' validation results

Indicator	Score	Levels of Validation
Language Aspect Eligibility Evaluation	91%	Extremely valid
Evaluation of the Effects of Learning Strategies	85%	Extremely valid
Visual Evaluation	81%	Valid
Material Relevance Aspects Assessment	90%	Extremely valid
Aspects of Organizing Materials Evaluation	83%	Valid
Assessment Aspect Evaluation / Practice Questions	85%	Valid
TOTAL	86%	Extremely valid

The summary of the overall product validation results is given below after receiving the findings from each validator (see Table 7).

Table 7. Product validation results are recapitulated

No	Validator	Average	Levels of Validation	Interpretation
1	Material Expertise			
2	Media Specialists	87.33%	Extremely valid	Unrevised use is possible
3	User			

3.3.3 Simulation

The simulation was performed on class X high school students in the form of a limited trial of 20 people, a extensive trial of 50 people (from two classes in two schools), and a product test of 26 people. The lesson design in this study takes the form of distributing student response questionnaires that have been given simulations using created android-based media. Table 8 summarizes the results of limited trials, extensive trials, and product trials.

316 **Table 8.** Recapitulation of student response results

Indicators	Limited Trial		Extensive Trial		Product Test	
Language Aspect Eligibility Evaluation	85%	very strong	78%	strong	80%	strong
Evaluation of Learning Strategies' Effects	87%	strong	76%	strong	82%	strong
Visual Evaluation	83%	strong	76%	strong	81%	strong
TOTAL	85%	very strong	77%	strong	81%	strong
Criteria				Usefull for learning		

317

318 With a response score of 81%, the analysis of student response results revealed a strong interpretation
 319 (see Table 8). This demonstrates that students feel helped in increasing mathematical critical thinking
 320 skills after receiving android-based learning media on trigonometry material. Furthermore, the
 321 developed product or media has been declared valid and can be used for learning (see Table 8).

322 3.4 Implementation Stage

323 Experiments were conducted on students from two classes in one school, each with 24 students. The
 324 first class is known as the experimental class, and the second is the control class. The experimental
 325 class consists of students who learn using the developed Android application media, while the control
 326 class consists of students who learn without using the developed Android application media. Based
 327 on the assumption test analysis using JASP Statistics software, it is found that the data is normally
 328 distributed and has a homogeneous variance. This is followed by a parametric test, namely the
 329 independent sample t-test (see Table 9).

330 **Table 9.** Independent sample t-test (one-tailed)

Data	t-value	df	P-value
Score of Mathematical Critical Thinking	2.538	46	0.007

331

332 The P-value from the independent sample t-test results (see Table 9) is 0.07. As a result, those who
 333 learn using the developed android application media have better mathematical critical thinking skills
 334 than those who do not learn using the developed android application media.

335 3.5 Evaluation Stage

336 The ADDIE model's final stage is evaluation. The researcher solicited responses from students who
 337 had studied with the developed Android application media during this stage of evaluation. Each
 338 action elicits a variety of reactions, both positive and negative. The most common positive response
 339 is that students' learning processes are more flexible. Students can study wherever and whenever they
 340 want. Students can also study the material thoroughly and freely select material that is considered
 341 poorly understood throughout the material's various sections.

342 In addition to positive responses, there are negative responses that necessitate improvements in the
 343 developed Android application media. This is because life is never static; it is constantly changing
 344 and improving with each stage. The negative response, in the form of criticism and constructive
 345 suggestions, is that not all students have access to a cellphone with the most recent version as a
 346 device for using android application media in learning mathematics. So, in line with the research of
 347 Hapsari and Fahmi (2021), the researchers intend to carry out further development of this application,
 348 and the responses and suggestions obtained during the study were used as a reference for
 349 improvement.

350 4 Discussion

351 The findings of a study on the development of learning media with Android applications show that
 352 students' mathematical critical thinking skills improve. Furthermore, the interaction between learning
 353 resources and students, learning through Android application media can increase student interest in
 354 learning (Sari & Wati, 2020). This android application begins by creating learning media with
 355 Microsoft Power-Point, which is then enhanced with I-Spring and Website 2 APK Builder. This
 356 demonstrates the advantages that students gain from the learning process, which is simple to create,
 357 free, and not overly demanding.

358 This android learning media also makes use of other applications in its development, such as Google
 359 Forms and Wizer.me. This is thought to make it easier for students and teachers to conduct online
 360 learning in the form of worksheets, attendance lists, and learning evaluations that parents can access.
 361 It is hoped that by using interactive worksheets, students' mathematical abilities will improve
 362 (Kurniansyah et al., 2022; Pertiwi et al., 2021).

363 The created media summarizes trigonometry material with a scientific approach to help students
 364 improve their mathematical critical thinking skills. This media is developed in stages to produce
 365 learning media products that are suitable for use in the learning process. Several needs analyses were
 366 performed in the first stage of the development of the developed product, which included three types
 367 of analyses: user needs analysis, student learning style analysis, and curriculum analysis (Fahmi et
 368 al., 2019; Marbán & Mulenga, 2019). This can be determined during the preliminary observations.
 369 The following analysis is to determine the theme and scope of the learning media so that the media
 370 developed is limited. The following analysis is to determine the theme and scope of the learning
 371 media so that the media developed is limited. This stage is completed by paying close attention to the
 372 material being created.

373 At the design stage, the goal is to sketch out the content of the android media, which is created with
 374 student characteristics in mind. Flowcharts, storyboards, and user interfaces are then created.
 375 Flowcharts are created to provide a high-level over-view of the flow or course of learning media
 376 from one slide to the next. The story-board is used to describe each slide, which includes an image
 377 display, conversation bubbles, and other pertinent information (Herbst et al., 2014; Jones, 2008;

Webel & Conner, 2017). The results of this stage are displayed in the interface. This design stage went through several revisions based on the validator's direction and input before becoming a complete media design. Following the results of the tests, the media design underwent at least two improvements to produce a product ready for testing.

During the development stage, researchers create the necessary learning media elements, such as text, images, videos, and materials, into a complete media that is ready to use. After the product is completed, it is validated by experts, including material experts, media experts, and math teachers. The validation process is carried out because it can help to improve the developed media (Fahmi et al., 2019; Nurwijayanti et al., 2019; Suarsana et al., 2018). Validation is based on an evaluation of the feasibility of linguistic aspects, evaluation of effects for learning strategies, evaluation of visual aspects, evaluation of material relevance aspects, evaluation of material organization aspects, and evaluation of evaluation aspects in the form of tests (Hidayat et al., 2022; Kurniansyah et al., 2022).

The implementation stage is a full learning experiment. At this point, it is clear that students who study with android application media have better mathematical critical thinking skills than students who do not study with android application media. One of the most significant reasons is that students' learning processes are more flexible. Students can study whenever and wherever they want. Students can study whenever and wherever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections. This is consistent with Kurniansyah et al. (2022) belief that interesting and interactive learning media can increase students' learning motivation.

The evaluation stage results indicate that the development of this android application medium is not only recommended for trigonometry material but also materials with a connection to trigonometry, such as calculus. This is because learning mathematics is interconnected with other subjects. If students have mastered the prerequisite material's mathematical critical thinking skills, then mastering the next material's mathematical critical thinking skills should not be too difficult (Lestari et al., 2021; Priatna et al., 2020; Setiana & Purwoko, 2021). Furthermore, due to the dynamic development of technology in mathematics learning, the material presented must be developed in Android application media. This is consistent with the fact that, to foster meaningful learning for students, the mathematical material developed on Android application media must also be linked to the real-life experiences that students have daily (Purwasih et al., 2020; Van Den Heuvel-Panhuizen, 2003).

5 Conclusion

The process of developing android-based learning media on trigonometry material has gone through ADDIE development procedures, namely (1) Analysis, (2) Design, (3) Development, (4) Implementation, and (5) Evaluation. The developed media have been valid and practical and have gone through product testing to see their effectiveness. The achievement of students' mathematical critical thinking skills who learn using android-based media is better than those who learn without using android-based media. The achievement of students' mathematical critical thinking skills, who received learning using android-based media and those who did not use android-based media, were both in the medium category.

Review Comment

Independent Review Report, Reviewer 2

1. It can be emphasized why Android-based Trigonometry is needed in their manuscript. The research motivation needs to be explained more fully in the research question section.
2. The authors do not make it clear what are the novel investigations and findings here. Authors need to more clearly demonstrate how this paper solves a novel and important teaching and learning problem in mathematics (trigonometry).
3. Although the author(s) gave detailed information about the Android-based Trigonometry Learning in the introduction part of the paper, they could not make the connection between their study and Android-based Trigonometry Learning.
4. The article focuses more on the ADDIE design model and its phases.
5. With the title "How can Android-based Trigonometry Learning improve the math learning process?", the importance of Android-based Trigonometry Learning in their study can be explained.
6. Trigonometry is a broad subject. What does the developed design include? Limitations should be specified.
7. Please give more information about Experimental Process. It's not clear what exactly you do with Android-based Trigonometry in math class. It would be useful to explain the processes in the experimental and control groups in detail.
8. The method title of the research is not sufficient. What research method was adopted? Why? Which data collection tools were used? How was the validity and reliability of these data collection tools ensured? How was the data analyzed? What statistical analyzes were done? Please give more information about the sample in method.
9. According to what basis were the evaluations in Table 4, Table 5, Table 6, and Table 7 made? Are there rubrics or criteria for assessments?

10. How was the students' mathematical critical thinking score calculated? By a test? How many questions were in this test? How was it evaluated? Can you give more detailed information about the mathematical critical thinking test? Regarding reliability and validity?
11. How were the experimental and control groups determined? Are these classes equivalent? In quasi-experimental studies, it is a prerequisite that the groups are equal. Were the experimental and control groups pre-tested? Students ever taken Android-based classes?
12. What did Android-based Trigonometry provide that other methods did not provide so that students' mathematical critical thinking skills improved?
13. Why did you use the ADDIE model? What is the difference from the existing Waterfall model? It should cover more fully what aspects of the ADDIE model are needed to design Android-based Trigonometry teaching and learning.
14. What ethical permissions have you received?
15. How was the difficult topic for students determined?
16. About research question 2 it is necessary to elaborate on the specific teaching and learning process of how the Android-based Trigonometry math class was conducted.
17. Android-based learning is a specialized technology for tackling challenges in a variety of situations and contexts. Although this point is explained in this article, its effect on education is read abstractly.
18. It is not clear how the designed material facilitates learning? Transferring the information in the books to android phones? Or is there a didactic dimension?

Review Comment

Independent Review Report, Reviewer 3

The abstract must clarify the objective of the study and the methodology used (design, type of research and statistical analysis).

1. In the introduction it is necessary that in this section the object of study is developed and the objective of the study is written well.
2. The materials and methods must develop the methodology in relation to the study (research design, type of research and statistical analysis). Determine the selection criteria for key informants.
3. The conclusions must be articulated and must be consistent with the research questions, objectives and results of the study. You are recommended to review it.
4. It could be incorporated into an additional section indicating the difficulties they had in carrying out the research and the new lines of research that are generated from this study.

Check List

- a. Is the quality of the figures and tables satisfactory?
Yes
- b. Does the reference list cover the relevant literature adequately and in an unbiased manner?
Yes
- c. Are the statistical methods valid and correctly applied? (e.g. sample size, choice of test)
Yes
- d. Is a statistician required to evaluate this study?
Yes
- e. Are the methods sufficiently documented to allow replication studies?
Yes

QUALITY ASSESSMENT:

Rigor : 3

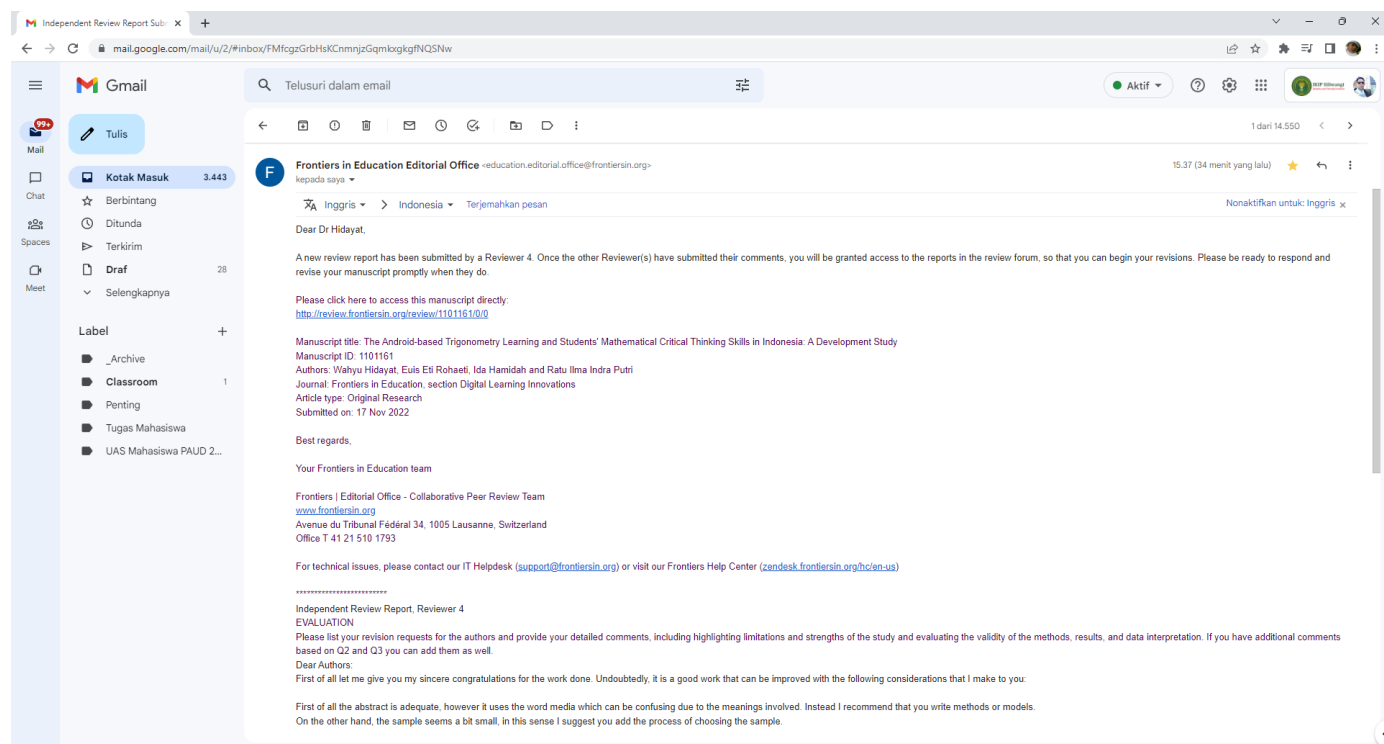

Quality of the writing : 3

Overall quality of the content : 3

Interest to a general audience : 4

Editor Decision : Revision Required

Review Comment

Independent Review Report, Reviewer 4

Dear Authors:

First of all let me give you my sincere congratulations for the work done. Undoubtedly, it is a good work that can be improved with the following considerations that I make to you:

First of all the abstract is adequate, however it uses the word media which can be confusing due to the meanings involved. Instead I recommend that you write methods or models.

On the other hand, the sample seems a bit small, in this sense I suggest you add the process of choosing the sample.

In addition, it would be advisable that you dedicate a section in the method to explain the sample and its characteristics, as well as the characteristics of the instrument, since you only speak in a very general way and focused on the design and elaboration of the study.

You should also add research objectives or hypotheses in this section, as they would help the reader to better understand the article.

Finally, the conclusion section should be more extensive, demonstrating that the objectives that were foreseen have been fulfilled.

Check List

a. Is the quality of the figures and tables satisfactory?

Yes

b. Does the reference list cover the relevant literature adequately and in an unbiased manner?

Yes

c. Are the statistical methods valid and correctly applied? (e.g. sample size, choice of test)

Yes

d. Is a statistician required to evaluate this study?

Yes

e. Are the methods sufficiently documented to allow replication studies?

No

Respond to Reviewers Comments

Reviewer 2:

Thank you for providing a review comment for my article.

Based on the comments you gave, we have made improvements (blue font in the revised manuscript), and we present the recap in the following Table:

No	The Reviewer-2 comment	Respond to the Reviewer-2
1	It can be emphasized why Android-based Trigonometry is needed in their manuscript. The research motivation needs to be explained more fully in the research question section.	Comments 1 to 3 have been corrected in the Introduction section.
2	The authors do not make it clear what are the novel investigations and findings here. Authors need to more clearly demonstrate how this paper solves a novel and important teaching and learning problem in mathematics (trigonometry).	
3	Although the author(s) gave detailed information about the Android-based Trigonometry Learning in the introduction part of the paper, they could not make the connection between their study and Android-based Trigonometry Learning	
4	The article focuses more on the ADDIE design model and its phases.	ADDIE development research conducted by researchers aims to develop android-based learning media on trigonometry material. All stages of the ADDIE method have been carried out to produce valid and practical android-based learning media products and provide the effect of product implementation on students' mathematical critical thinking skills.
5	With the title "How can Android-based Trigonometry Learning improve the math learning process?", the importance of Android-based Trigonometry Learning in their study can be explained.	We have fixed it in the Title

No	The Reviewer-2 comment	Respond to the Reviewer-2
6	Trigonometry is a broad subject. What does the developed design include? Limitations should be specified.	The subject matter of trigonometry that is used as the focus of this research is: (1) Trigonometric ratios and angle measures; (2) Special angle trigonometric ratio; (3) Graphs of trigonometric functions; and (4) The sine, cosine, and area rules of a triangle. We have fixed it in the Method section.
7	Please give more information about Experimental Process. It's not clear what exactly you do with Android-based Trigonometry in math class. It would be useful to explain the processes in the experimental and control groups in detail.	We have fixed it in the method section (implementation stage) and in the result section (implementation).
8	The method title of the research is not sufficient. What research method was adopted? Why? Which data collection tools were used? How was the validity and reliability of these data collection tools ensured? How was the data analyzed? What statistical analyzes were done? Please give more information about the sample in method.	We have fixed it in the method section
9	According to what basis were the evaluations in Table 4, Table 5, Table 6, and Table 7 made? Are there rubrics or criteria for assessments?	We have fixed it in the method section (development stage)
10	How was the students' mathematical critical thinking score calculated? By a test? How many questions were in this test? How was it evaluated? Can you give more detailed information about the mathematical critical thinking test? Regarding reliability and validity?	We have fixed it in the method section
11	How were the experimental and control groups determined? Are these classes equivalent? In quasi-experimental studies, it is a prerequisite that the groups are equal. Were the experimental and control groups pre-tested? Students ever taken Android-based classes?	We have fixed it in the method section (implementation stage)

No	The Reviewer-2 comment	Respond to the Reviewer-2
12	What did Android-based Trigonometry provide that other methods did not provide so that students' mathematical critical thinking skills improved?	We have fixed it in the discussion section
13	Why did you use the ADDIE model? What is the difference from the existing Waterfall model? It should cover more fully what aspects of the ADDIE model are needed to design Android-based Trigonometry teaching and learning.	In our study, we did not use the Waterfall model. ADDIE development research conducted by researchers aims to develop android-based learning media on trigonometry material. All stages of the ADDIE method have been carried out to produce valid and practical android-based learning media products and provide the effect of product implementation on students' mathematical critical thinking skills.
14	What ethical permissions have you received?	Ethical clearance from the Institute for Research and Community Service of IKIP Siliwangi as my institution.
15	How was the difficult topic for students determined?	This issue has been presented in the introduction section. starting from the results of research from other researchers to the results of TIMSS and PISA.
16	About research question 2 it is necessary to elaborate on the specific teaching and learning process of how the Android-based Trigonometry math class was conducted.	We have fixed it in the discussion section
17	Android-based learning is a specialized technology for tackling challenges in a variety of situations and contexts. Although this point is explained in this article, its effect on education is read abstractly.	Android-based learning in this study is a technology that is used as a learning medium to help students interact more while studying during the COVID-19 pandemic. This is because learning in Indonesia at the beginning of 2022 is still being applied to Study from Home. so we need learning media that can make students interact with the material and the teacher.
18	It is not clear how the designed material facilitates learning? Transferring the information	We have fixed it in the discussion section

No	The Reviewer-2 comment	Respond to the Reviewer-2
	in the books to android phones? Or is there a didactic dimension?	

Reviewer 3:

10 Abstract

11 Using ICT-based interactive learning media is a learning method that strongly supports the teaching
12 and learning process for students and teachers during the COVID-19 pandemic. This ICT-based
13 learning media must be easily accessible to teachers and students, and one of the interactive media
14 that is easily accessible is android-based learning media. This development research aims to design
15 android-based learning media on valid trigonometric material and improve students' mathematical
16 critical thinking skills. This development research using the ADDIE model took 121 people
17 consisting of expert validators, user (teacher), and students. The expert validators consisted of one
18 mathematics education material expert and one ICT expert. Meanwhile, user represented by one
19 mathematics teacher were involved in validating the use of the media design. In addition, there were
20 participants from among students, which included 118 class X high school students throughout the
21 Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive
22 trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school
23 in the medium cluster. So, the reason for taking the sample represents the condition of students both
24 on the island of Java and in Indonesia. The results showed that the developed android-based learning
25 media was valid and could be used without revision with a combined percentage of 87.33%, with
26 details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at
27 86%. The results of the practicality test on students of 81% showed that the Android-based learning
28 media design had a strong response, so the learning media made were very practical to use. The
29 product test results show that the achievement of mathematical critical thinking skills of students who
30 learn to use android-based learning media is better than those who learn not to use android-based
31 learning media.

32 1 Introduction

33 The COVID-19 pandemic has forced the world of education to make maximum use of technology in
34 the delayed learning process. Learning in mathematics that utilizes technological advances in the
35 form of online learning can facilitate teachers and students simultaneously in delivering and
36 obtaining subject matter (Bertram, 2020; Chai et al., 2013; Mahmud et al., 2022; Reddy et al., 2021;

Su et al., 2022). One of the uses of online learning media that is currently in great demand by various groups is the use of Android on smartphones (mobile). The development of information technology has now been used in various schools to implement interactive learning media based on Android using a PC or smartphone.

The use of Android as a learning medium gets a positive response from various groups and also provides some convenience in the online learning process. Churiyah et al. (2020) recommend that there are several conveniences in android-based online learning, including for teachers that student learning outcomes can be known directly, learning activities are not limited to distance, time, and place, in the learning process, students can be accompanied by parents, students can access the network with the internet, students can take advantage of the media in their surrounding environment and have a lot of time with family. Irfan and Wulandari (2019) stated that on Android-based learning media, students can learn more easily without being limited by time and place, nor do they need to carry books. The development of learning media at this time has utilized multimedia elements that are packaged in the form of an Android application so that it can reduce student boredom in learning. However, the obstacles that often arise are not only from student factors but also from teachers and media or teaching materials that play an important role in the mastery of understanding students' prerequisite materials (Hidayat et al., 2022; Pertiwi et al., 2021; Rohaeti et al., 2019; Sulistyo & Kurniawan, 2020; Tran et al., 2020; Wijaya et al., 2020).

In addition to the benefits that are a positive impact of using Android, there are also some negative impacts that arise, including that there are still many students who do not focus on learning because they are too busy with their cellphones used for social media and also playing games (Irfan & Wulandari, 2019). In addition, there are also some groups who still have difficulty getting internet access, and there are also families who do not have mobile devices. However, the positive impacts are far greater than the negative impacts. The government has also taken measures to minimize the negative impact by providing study quota assistance and creating study groups so that students who do not yet have devices can still study by joining with friends who have mobile devices.

Android-based learning media uses cellphones as a tool to facilitate effective and efficient learning so that students may learn (Martono & Nurhayati, 2014; Novaliendry et al., 2020). This is due to the Linux-based Android operating system for mobile devices, including smartphones and tablet computers, which Google and the Open Handset Alliance developed. Android is intended to be an operating system that offers developers an open-source platform to build applications (Hakky et al., 2018; Irfan & Wulandari, 2019; Sari & Wati, 2020). Since smartphones and tablets may be used as learning aids anytime, anywhere, and with a high level of practicality, attractiveness, efficacy, and efficiency, android-based learning media is a learning medium.

Irfan and Wulandari (2019) note that the eligibility criteria for android-based learning media are categorized into two aspects, namely content or material aspects and media aspects. Aspects of the material can be viewed in terms of suitability, quality of content and objectives, and instructional quality. The media aspect can be viewed in terms of ease of use and navigation, in terms of aesthetics or beauty, in terms of media integration, and in terms of technical quality. While the criteria for android learning media, according to Sari and Wati (2020), are carried out based on student questionnaires with several aspects as follows: (1) Practical aspects; (2) Aspects of visual appearance; (3) language aspect; and (4) Aspects of effects for learning strategies. Meanwhile, according to Hakky et al. (2018), the eligibility criteria for android-based learning media are divided into two, namely material assessment and media assessment. The assessment of a piece of content takes into some factors, including: (1) the relevance of the content; (2) the structure of the content;

(3) the evaluation and practice questions; (4) the linguistic element; (5) the effects on learning techniques; and (6) the visual appeal. The media evaluation also takes into account: (1) language features; (2) effects on learning techniques; (3) factors of software engineering; and (4) aspects of aesthetic appeal. While evaluating student responses, considerations for both learning methodologies and visual appeal are taken into account.

The eligibility criteria for the Android-based learning media used are similar, then the researchers used three criteria: material criteria, media criteria, and student response questionnaires. The material assessment criteria are divided into several categories: (1) the material's relevance; (2) its organization; (3) evaluation and practice questions; (4) the language aspect; (5) the effects on learning strategies; and (6) its visual appearance. Language aspects, effects for learning strategies, software engineering aspects, and visual appearance aspects are all included in media evaluation. The following topics are covered in student response questionnaires: (1) practical aspects, (2) visual appearance aspects, (3) language aspects, and (4) effects on learning strategies.

Trigonometry is one of the mathematical topics that can help you develop more mathematical skills (Basir & Maharani, 2018; Wijaya et al., 2020). Furthermore, trigonometrical material is used in many other fields of science, such as architecture, navigation, engineering, studying the motion of celestial bodies such as the sun, moon, and stars and their calculations, and several other branches of physics (Basir & Maharani, 2018; Purwanti, 2017). There are so many roles for this trigonometry material that it is critical that students understand it at the high school level and even higher, namely in college, where trigonometry material appears frequently and becomes one of the requirements for graduation.

Trigonometry's importance is still not balanced with students' mathematical critical thinking skills. Higher-order thinking skills in mathematics are expected to be important learning outcomes (Abdullah et al., 2016; Hendriana et al., 2022; Kurniati et al., 2015; Lewis & Smith, 1993; Zetriuslita & Ariawan, 2021). The ability to solve non-routine problems is defined as critical thinking (Kurniati & As' ari, 2019; Mogari & Chirove, 2017; Sari & Hidayat, 2019). Thus, critical thinking skills can be defined as logical thinking that is reasoned and focused on solving mathematical problems (Lewis & Smith, 1993; Paul & Elder, 2019; Widyatiningtyas et al., 2015). Thus, mathematical critical thinking ability is a systematic ability that can be used to solve mathematical problems by combining prior knowledge with mathematical reasoning abilities.

However, in reality, mathematics learning activities in Indonesia have not fully trained students' critical thinking skills. This can be proven from several times the results of the Trends in International Mathematics and Science Study (TIMSS) with high-level cognitive questions that measure critical thinking skills. In the 2015 TIMSS, Indonesia was ranked 46th out of 51 countries with a score of 397 (Safari, 2021). Then in the 2018 Program for International Student Assessment (PISA) results, it shows that Indonesia's achievement in mathematics has a score of 379 which indicates a decrease of 7 points from that obtained in 2015 (Setiawan et al., 2021). This concludes that the improvement of students' mathematical critical thinking skills still needs to be improved.

Student's difficulties in learning trigonometry during the COVID-19 pandemic make it urgent to research teaching media development. In this case, the researcher studied the effect of android-based learning media on trigonometry material to improve students' mathematical critical thinking skills. This research is expected to produce a valid product about android-based learning media in trigonometry material. In addition, the resulting product can also meet practical aspects so that it can be widely applied in learning.

Aside from the above study, the authors want to see how much Android-based trigonometry learning media is expected to improve students' mathematical critical thinking skills during the COVID-19 pandemic. This study aims to analyze and investigate: (1) the process of developing android-based learning media on trigonometric material; and (2) the results of the application of android-based trigonometry learning in improving students' mathematical critical thinking skills.

2 Research Methods

The ADDIE (Analysis, Design, Development, Implementation, and Evaluation) model is used in this development research to create android-based learning media on trigonometry material to improve students' mathematical critical thinking skills during the COVID-19 pandemic. Figure 1 depicts the stages of the ADDIE development model.

Participants involved in developing the implementation of this android-based learning media product amounted to 121 people, expert validators, the user (teacher), and students. The expert validators consisted of one material expert in the field of mathematics education (Dr. Sri Adi Widodo, M.Pd, lecturer at the Universitas Sarjanawiyata Tamansiswa, Yogyakarta, Indonesia) and one ICT expert (Dr. Surya Amami Pramuditya, M.Sc, Head of Media and Learning Device Development at the Universitas Swadaya Gunung Jati, Cirebon, Indonesia). Meanwhile, the user represented by one of the mathematics teachers (Agie Ginarnjar, S.Pd, Guru SMA Negeri 2 Padalarang, West Java, Indonesia) was involved in validating the use of media designs. In addition, there were participants from among students, which included 118 class X high school students throughout the Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school in the medium cluster. So, the reason for taking the sample represents the condition of students both on the island of Java and in Indonesia.

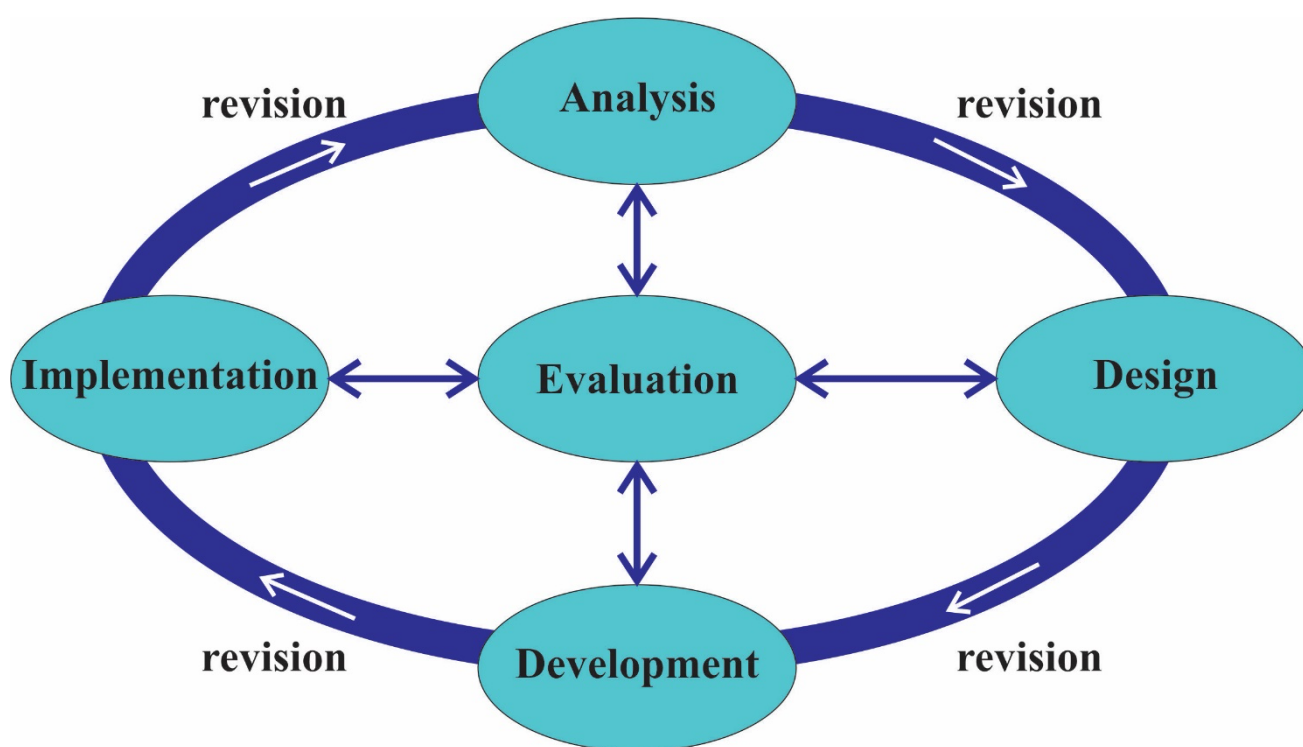

Figure 1. ADDIE development model

The subject matter of trigonometry that is used as the focus of this research is: (1) Trigonometric ratios and angle measures; (2) Special angle trigonometric ratio; (3) Graphs of trigonometric functions; and (4) The sine, cosine, and area rules of a triangle.

Students' mathematical critical thinking ability is measured through a test with the characteristics of a good critical thinking ability test. The following is an example of a student's mathematical critical thinking ability test (see Figure 2).

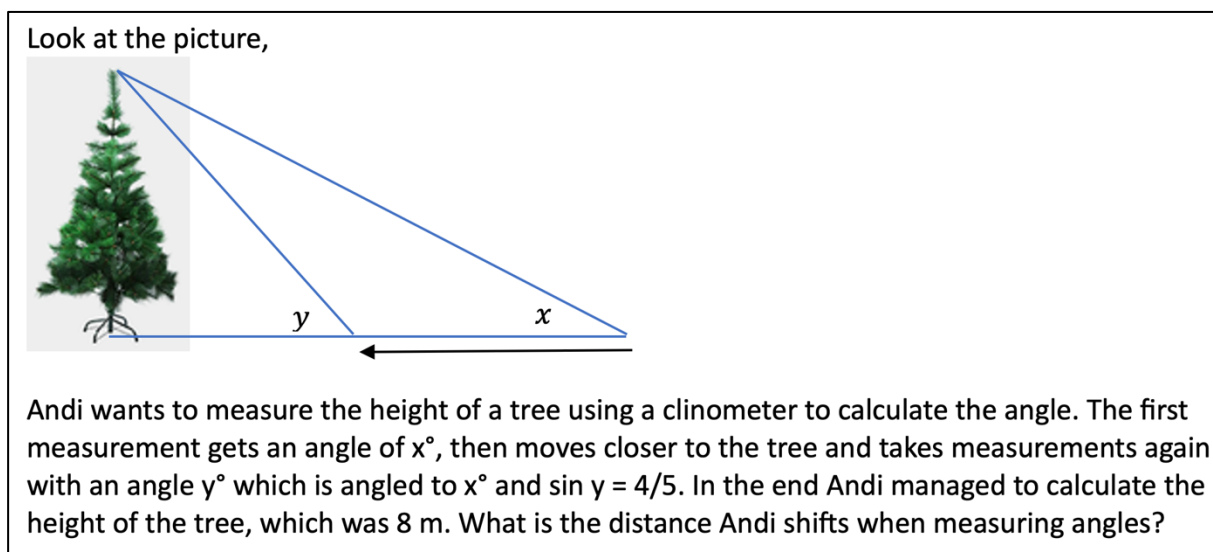

Figure 2. An example of a student's mathematical critical thinking ability test

2.1 Analysis Stage

The analysis is performed to determine the learning needs and competencies that students must master. Details of activities during the analysis stage, specifically:

- a. A user needs analysis is a study that is conducted to determine what is required in the development of learning media. The information was gathered through interviews with the goal of eliciting information about problems encountered while learning trigonometry material.
- b. Identification of needs (problems) seeks to discover the solutions that must be proposed in the design of android-based learning media in order for students to master the competencies required.

2.2 Design Stage

This stage's activities are divided into five steps, which are as follows:

- a. Developing competencies, namely developing specific competencies that students must achieve in designing android-based learning media, so that students can be self-sufficient (mathematical critical thinking skills).
- b. Determine the learning material, which is trigonometry in class X SMA. This material was chosen to keep the discussion from becoming too broad.

- c. The researcher creates an android-based learning media strategy to aid the learning process and ensure that the predetermined competency goals are met. This product contains at least three media that are combined into one, namely a Google Form, a Wizer.me interactive worksheet, and an Apperception video.
- d. Evaluation, specifically evaluating the equipment and conditions required by students in order to achieve the learning competencies that are expected.
- e. Sources, specifically locating and determining learning resources that can aid in the creation of this android.

2.3 Development Stage

The development stage consists of producing or creating specifications for android-based learning media that were determined during the design stage. The android-based learning media must then be validated before being used in the learning process once it has been completed in production. Activities carried out during the development stage include:

- a. Creating learning media, specifically Android-based learning media Android-based learning media is created with the PowerPoint application, which is easily accessible on a laptop. Furthermore, it is converted into an application using APK Builder Pro 3.4, so that it becomes a product in.html and is ready to be explored into an application that is ready to be installed. making android-based learning media that is scientifically tailored to the needs of students learning trigonometry material.
- b. Validation of Learning Media, which includes expert, user, and audience validation in the form of a questionnaire the validation of learning media. This validation is intended to gather feedback for revising android-based learning media so that it can be said to be usable.

In this case, expert validation is performed by a single lecturer who is both a material expert and a media expert. Mathematics teachers perform user validation, and students are tested for audience validation. The validated criteria for assessment aspects include:

- a. Material expert assessment: (1) aspects of material relevance; (2) aspects of material organization; (3) aspects of evaluation and practice questions; (4) language aspects; (5) effects of learning strategies; and (6) visual appearance.
- b. Evaluation of media experts: (1) language aspects; (2) effects on learning strategies aspects; (3) software engineering aspects; and (4) visual appearance aspects.
- c. User evaluation: (1) aspects of material relevance; (2) aspects of the material organization; (3) aspects of evaluation and practice questions; (4) language aspect; (5) effects for learning strategies; and (6) visual appearance.
- d. A student response questionnaire with three sections: (1) language aspects, (2) effects for learning strategies, and (3) visual appearance aspects.

Rubric or product development validation criteria are presented in Table 1.

Table 1. Product development validity criteria

Score (%)	Category
81-100	Very valid

Score (%)	Category
61-80	Valid
41-60	Quite valid
21-40	Invalid
0-20	Very invalid

In addition to focusing on the design and manufacture of android-based learning media, at this development stage, simulations were also carried out to support the validation stage (especially the student response questionnaire). Simulations were carried out on class X SMA students in the form of a limited trial of 20 people, an extensive trial of 50 people (from two classes in two schools), and a product test of 48 people (from two classes in one school, each with 24 students). The lesson design in this study is in the form of distributing student response questionnaires that have been given simulations using android-based media that have been created. Rubric or product development practical criteria are presented in Table 2.

Table 2. Product development practical criteria

Score (%)	Category
81-100	Very Practical
61-80	Practical
41-60	Quite of Practical
21-40	Less Practical
0-20	Not Practical

2.4 Implementation Stage

The implementation stage is when the mathematics teacher delivers learning material in the classroom. Material is submitted using android-based learning media that has been validated by experts, as well as a control class that does not receive media as a benchmark for evaluating material for the experimental class. The number of samples at this implementation stage was 48 from two classes (24 people each).

Experimental and control class were determined randomly, and both classes had the same ability based on the average achievement of the previous material. Before the product test was carried out, the two classes had yet to experience learning using android-based media.

One of the objectives of this research is to improve students' mathematical critical thinking skills using android-based learning media that has been developed. Therefore, a mathematical critical thinking ability test was conducted at the end of the lesson. The results were analyzed using a statistical test, the independent sample t-test, using JASP Statistics software.

2.5 Evaluation Stage

The evaluation was carried out to determine the quality of the finished products, which were android-based learning media. This level of quality will be evident if android-based learning media can improve students' mathematical critical thinking skills both before and after learning. In this step, the researcher classified the data to improve students' mathematical critical thinking skills, which would be measured using test questions administered at the beginning and end of the lesson. If students' mathematical critical thinking skills improve, learning with android-based learning media is considered successful; however, if there is no improvement or a decrease, the developed android-based learning media must be improved. Figure 3 depicts the entire flow of research and development activities.

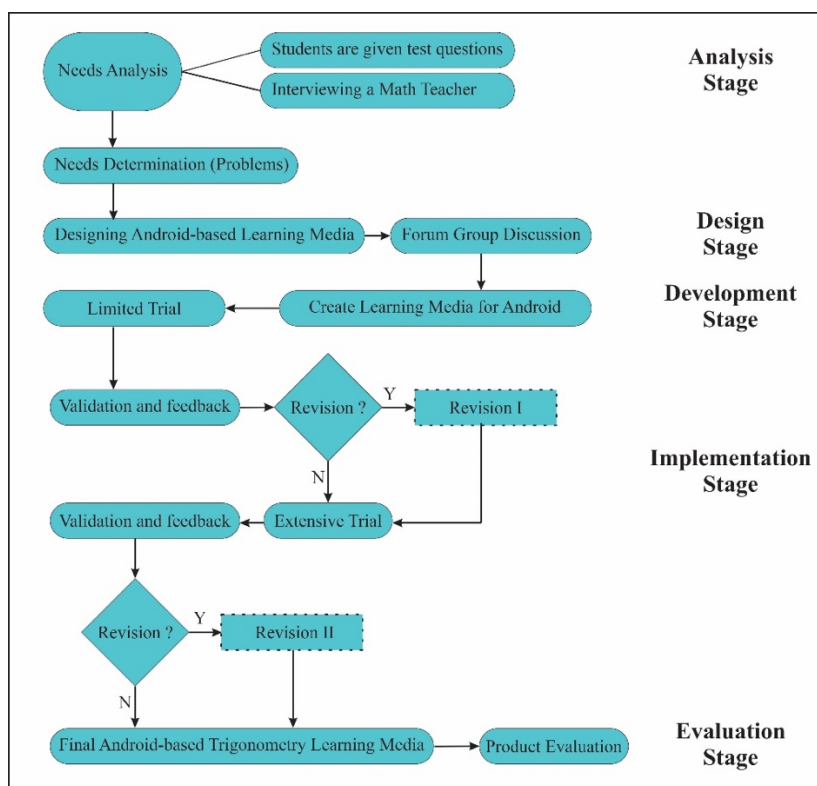

Figure 3. Flow of research and development activities

3 Results

This development produced learning media in the form of Android applications based on Trigonometry material. The resulting application is a file with an.apk extension that is installed on an Android smartphone. PowerPoint is used as a medium for application development, which is then

exported into an application using Website 2 APK Builder Pro 3.4. It also makes use of several supporting applications, such as g-form, interactive worksheets, and interactive videos, to create self-contained applications that teachers, students, and parents can easily control. The outcomes of the development stages used in the ADDIE development model (Analysis, Design, Development, Implementation, and Evaluation).

3.1 Analysis Stage

The following steps are required to determine the initial needs for developing learning media: (1) User Needs Analysis, (2) Student Learning Style Analysis, and (3) Curriculum or Content Analysis. Before moving on to the user requirements analysis stage, the problem is identified and the required solution is determined. Based on observations of classroom learning, student interviews, discussions with mathematics teachers, and readings from various articles, problems were identified, including students' basic mathematical abilities and lack of interest. This is caused by a number of things, including the lack of independent learning media, a lack of innovation and variety in the use of media, and a lack of use of Android devices as learning tools. Making learning media can be used to solve previous issues.

The need for the product is determined by analyzing user needs. Table 3 shows the data from observations and interviews used to determine needs.

Table 3. Observational and interview-based data

Evidenced	Analysis Findings
Examined subjects	Trigonometry
The learning procedure	Describe with examples, practice, and homework
Books or other educational resources are accessible.	Some textbooks can only be used at school; however, due to limited availability, not everyone can borrow textbooks from school.
The caliber of learning media	Still limited to powerpoint slides, which are rarely used. Furthermore, the media has not changed.
Student Situation	Difficulty understanding the material and requiring the teacher to explain it repeatedly; difficulty finding reference sources; and difficulty completing assignments
Teacher limitations in the classroom	Due to the perceived difficulty of the material, the inability of students to interact face-to-face due to the pandemic, and the short study periods at school, students lack the motivation to learn.
Students' technology as a source of independent learning	Some students have computers, but many more have Android smartphones that are underutilized.
Required media	Attendance, materials, videos to clarify the material, examples, and practice questions with discussion, as well

Evidenced	Analysis Findings
	as media that can be used for learning at home, are examples of media that can attract students' interest and attention.

The findings of the observations and interviews are then analyzed to determine user needs, which are supported by the specifications/features of learning media (see Table 4).

Table 4. Results of user need analysis

Requirement	Analysis Findings
User Aims	SMA/MA/SMK students in Class X
Learning Media Categories	Trigonometry learning media takes the form of an app that can be downloaded and installed on an Android smartphone for independent study.
Features that are required	1. Instructions for use 2. Contains fundamental competencies and learning objectives 3. There is an email-synchronized attendance list link (g-from) 4. Displaying materials and examples 5. Available instructional videos (edpuzels) 6. There are practice questions and discussions (wizer.me) 7. Developers' page for applications.

The analysis results related to the required features and content (see Table 4) must have the characteristics of learning media to produce a good display. This media development incorporates Alessi and Trollip's (Alessi & Trollip, 2000) media characteristics, namely: (a) introduction to learning media; (b) student control; (c) consistency; and (d) presentation mode. The start page in the form of the media title and developer identity marks the beginning. A login button is presented so that users can proceed to the next page. Student control allows users to interact with learning media. Control is accomplished through the use of specific buttons, namely menu and navigation buttons. In learning media, menu buttons include buttons for various menu options. Navigation buttons are used to move to specific pages, such as (1) Home, which takes you to the main page of learning media, (2) Next, which takes you to the next page, and (3) Back, which takes you back to the previous page. The goal of consistency is to make learning media more convenient for users. The following components have consistency applied to them: (1) putting the home, next, and back buttons at the bottom; (2) using consistent keys for the same purpose; (3) using consistent paragraphs, font sizes, and font types in the text; and (4) using a consistent color for one-way sections. while the presentation mode depicts the presentation of content in accordance with the requirements of visual elements, namely: 1) readability of media text, where learning is developed using clear and easy-to-read text. The font used is Maiandra GD, which is a suitable size and easy to read. Furthermore, the text color is adjusted to match the background color so that the text is legible. 2) Graphic quality is used in a display that is arranged with artistic quality and attractiveness. A good color element is

293 presented with a maximum of five color shades. 3) Video quality the video in this lesson is used to
 294 visualize the material through various examples from everyday life.

295 The next step is to analyze student learning styles after identifying user needs. This analysis is useful
 296 in determining what type of media will be created to suit students' learning styles in order to improve
 297 students' learning motivation. Table 5 shows the results of the analysis of student learning styles.

298 **Table 5.** Analysis of student learning styles

Analysis Findings	
Students prefer to learn in a relaxed and enjoyable environment, free of stress, with opportunities for observation, practice, and discussion.	
To discover the benefits of everyday learning, it is necessary to alternate between calculations and practice.	
Use of educational games to assess practice questions	

299 At the curriculum analysis or content stage, namely material relevant to the specified basic
 300 competencies. According to the syllabus, basic competencies and objectives/indicators are required
 301 for developing trigonometry learning media. Angle measures and trigonometric ratios, trigonometric
 302 ratios of special angles, graphs of trigonometric functions, rules of sin, cos, and area of triangles, and
 303 functions of trigonometric equations are all organized around these fundamental competencies. At
 304 this stage, the material compiled is guided by a variety of sources, including books, modules, and
 305 other supporting materials.

306 Other content that will be included in the learning media, such as videos, examples, and practice
 307 questions, must be determined in advance, in addition to the material. The videos created in this
 308 application are in the form of light videos at the beginning of learning that contains illustrations and
 309 examples of the application of trigonometry material to daily activities, and several videos are also
 310 given as examples of problem-solving. Practice questions are presented in wizer.me interactive
 311 worksheets to facilitate student work and teacher correction, and can be emailed to parents.

312 **3.2 Design Stage**

313 The design phase produces a flowchart that describes the sequence and structure of learning media, a
 314 storyboard with a template design plan, and an interface design. The created flowchart is then used as
 315 a guide for designing storyboards, resulting in a planning design that is in accordance with the media
 316 structure (see Figure 4).

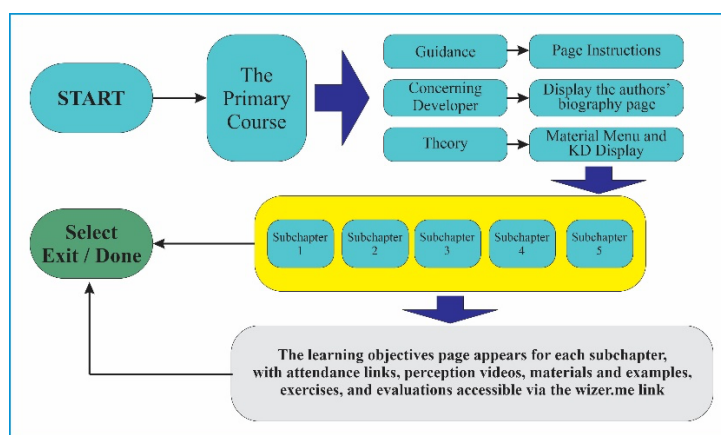

Figure 4. Flowchart of media structure

The storyboard is a rough outline of the display of the learning media that will be created, including the media's content, layout, and the majority of the elements that will be included (Herbst et al., 2014; Jones, 2008; Webel & Conner, 2017). The story-board is then used as a guide in creating the interface design. The interface design creates a real storyboard representation by paying attention to the previously analyzed elements and characteristics of the learning media, such as balance, color, text, graphics, and others (see Figure 5).

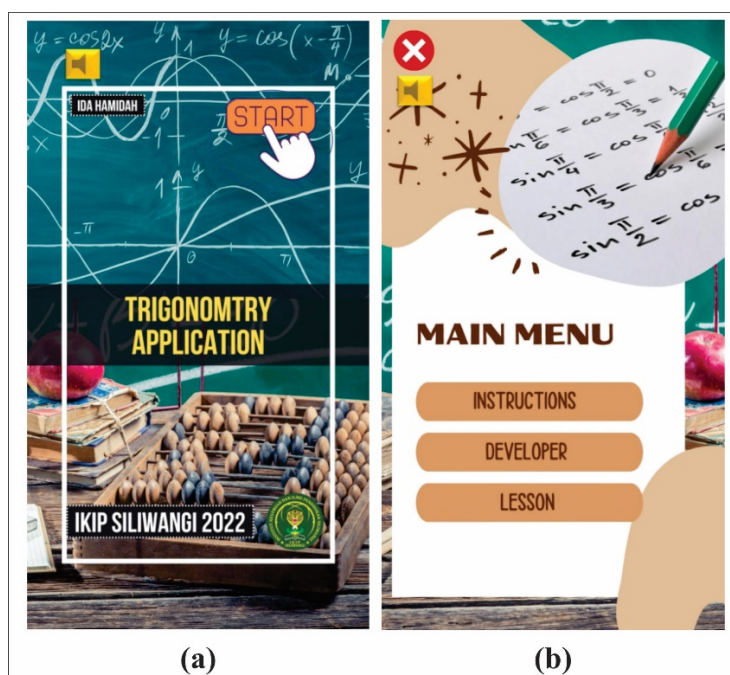

Figure 4. Interface design a) homepage and b) default menu page

The storyboard design is then translated into a real display or interface design to make it more appealing and user-friendly (see Figure 5). Furthermore, each resource includes information on learning objectives and attendance links (see Figure 6).

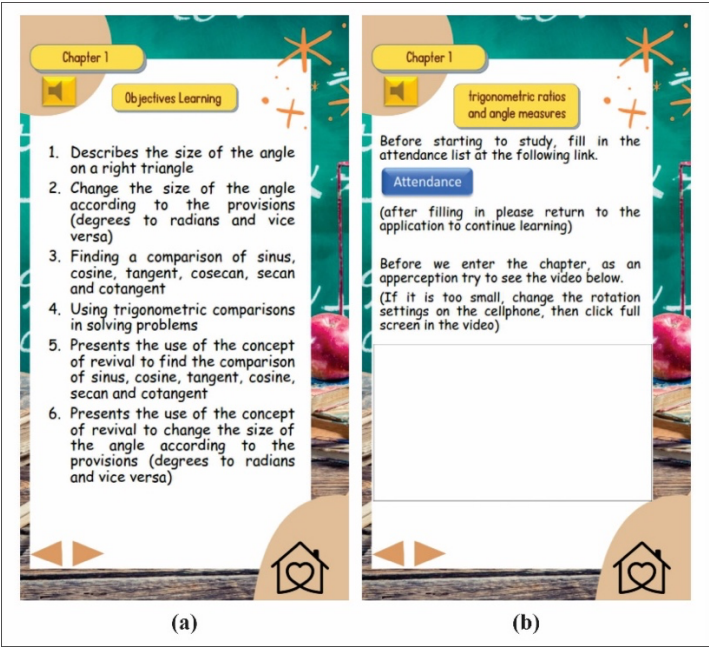

Figure 6. Interface design a) learning goals and b) attendance links

Exercises are also presented as a worksheet on each material page (see Figure 7). It is intended to continue to hone students' mathematical critical thinking abilities.

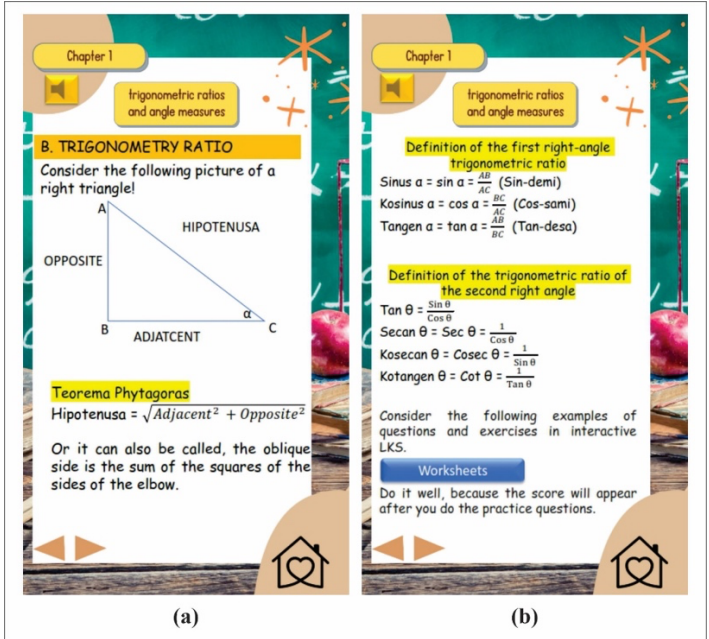

Figure 7. Worksheets and resource pages

3.3 Development Stage

Development is the stage of product development and testing in which the results of the analysis, and design are transformed into a complete finished product and validated by experts, specifically material and media experts. In addition to validation, the developer requests feedback and suggestions from expert validators in order to improve the developed media.

3.3.1 Making Educational Media

This android-based learning media is created in PowerPoint, which is then converted into an html file product by APK Builder Pro 3.4 and is ready to be explored into an application that is ready to be installed.

3.3.2 Learning Media Validation

Experts validate learning media (material experts, media experts, and users). Dr. Sri Adi Widodo, M.Pd. is the material's validator (Lecturer of Mathematics Education, Universitas Sarjanawiyata Tamansiswa Yogyakarta, Indonesia). Users validate the development of learning media, in addition to material experts and media experts. Agie Ginanjar, S.Pd., is a mathematics teacher at SMA Negeri 2 Padalarang in West Bandung, Indonesia. Table 6 shows the results of material and user/teacher validation.

Table 6. Material expert and math user/teacher validation results are recapitulated

Indicator	Material Experts'		Math User/Teacher	
	Score	Levels of Validation	Score	Levels of Validation
Language Aspect Eligibility Evaluation	100%	Very valid	91%	Very valid
Evaluation of Learning Strategies	85%	Very valid	85%	Very valid
Visual Evaluation	84%	Valid	81%	Valid
Material Relevance Aspects Assessment	80%	Valid	90%	Very valid
Aspects of Organizing Materials Evaluation	79%	Valid	83%	Valid
Assessment Aspect Evaluation / Practice Questions	75%	Valid	85%	Valid
TOTAL	84%	Valid	86%	Very valid

Dr. Surya Amami Pramuditya, M.Sc. is the media's, validator the media. He is the Head of Media and Learning Device Development at the Universitas Swadaya Gunung Jati, Indonesia. Table 7 summarizes the media expert validation results.

358

Table 7. Expert validation results recapitulated

Indicator	Score	Levels of Validation
Language Aspect Eligibility Evaluation	100%	Very valid
Evaluation of Learning Strategies	90%	Very valid
The aspect of software development	92%	Very valid
Visual Evaluation	84%	Valid
TOTAL	92%	Very valid

359 Based on the findings presented in Tables 5 and 6, the overall product validation results summary is
 360 87.33% (very valid), so the product design in the form of android-based learning media can be used
 361 without revision.

362 3.3.3 Simulation

363 The simulation was performed on class X high school students in the form of a limited trial of 20
 364 people, a extensive trial of 50 people (from two classes in two schools), and a product test of 48
 365 people (from two classes in one school, each with 24 students). The lesson design in this study takes
 366 the form of distributing student response questionnaires that have been given simulations using
 367 created android-based media. Table 8 summarizes the results of limited trials, extensive trials, and
 368 product trials.

369 **Table 8.** Recapitulation of student response results

Indicators	Limited Trial		Extensive Trial		Product Test	
Language Aspect Eligibility Evaluation	85%	Very practical	78%	Practical	80%	Practical
Evaluation of Learning Strategies' Effects	87%	Practical	76%	Practical	82%	Practical
Visual Evaluation	83%	Practical	76%	Practical	81%	Practical
TOTAL	85%	Very practical	77%	Practical	81%	Practical
Criteria				Usefull for learning		

370

With a response score of 81%, the analysis of student response results revealed a strong interpretation (see Table 8). This demonstrates that students feel helped in increasing mathematical critical thinking skills after receiving android-based learning media on trigonometry material. Furthermore, the developed product or media has been declared valid and can be used for learning (see Table 8).

3.4 Implementation Stage

Experiments were conducted on students from two classes in one school, each with 24 students. The first class is known as the experimental class, and the second is the control class. The experimental class consists of students who learn using the developed Android application media, while the control class consists of students who learn without using the developed Android application media.

Based on the assumption test analysis using JASP Statistics software, it is found that the data is normally distributed and has a homogeneous variance. This is followed by a parametric test, namely the independent sample t-test (see Table 9).

Table 9. Independent sample t-test (one-tailed)

Data	t-value	df	P-value
Score of Mathematical Critical Thinking	2.538	46	0.007

The P-value from the independent sample t-test results (see Table 9) is 0.07. As a result, those who learn using the developed android application media have better mathematical critical thinking skills than those who do not learn using the developed android application media.

3.5 Evaluation Stage

The ADDIE model's final stage is evaluation. The researcher solicited responses from students who had studied with the developed Android application media during this stage of evaluation. Each action elicits a variety of reactions, both positive and negative. The most common positive response is that students' learning processes are more flexible. Students can study wherever and whenever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections.

In addition to positive responses, there are negative responses that necessitate improvements in the developed Android application media. This is because life is never static; it is constantly changing and improving with each stage. The negative response, in the form of criticism and constructive suggestions, is that not all students have access to a cellphone with the most recent version as a device for using android application media in learning mathematics. So, in line with the research of Hapsari and Fahmi (2021), the researchers intend to carry out further development of this application, and the responses and suggestions obtained during the study were used as a reference for improvement.

4 Discussion

The findings of a study on the development of learning media with Android applications show that students' mathematical critical thinking skills improve. Furthermore, the interaction between learning resources and students, learning through Android application media can increase student interest in learning (Sari & Wati, 2020). This android application begins by creating learning media with Microsoft Power-Point, which is then enhanced with I-Spring and Website 2 APK Builder. This demonstrates the advantages that students gain from the learning process, which is simple to create, free, and not overly demanding.

This android learning media also makes use of other applications in its development, such as Google Forms and Wizer.me. This is thought to make it easier for students and teachers to conduct online learning in the form of worksheets, attendance lists, and learning evaluations that parents can access. It is hoped that by using interactive worksheets, students' mathematical abilities will improve (Kurniansyah et al., 2022; Pertiwi et al., 2021).

The created media summarizes trigonometry material with a scientific approach to help students improve their mathematical critical thinking skills. This media is developed in stages to produce learning media products that are suitable for use in the learning process. Several needs analyses were performed in the first stage of the development of the developed product, which included three types of analyses: user needs analysis, student learning style analysis, and curriculum analysis (Fahmi et al., 2019; Marbán & Mulenga, 2019). This can be determined during the preliminary observations. The following analysis is to determine the theme and scope of the learning media so that the media developed is limited. This stage is completed by paying close attention to the material being created.

At the design stage, the goal is to sketch out the content of the android media, which is created with student characteristics in mind. Flowcharts, storyboards, and user interfaces are then created. Flowcharts are created to provide a high-level over-view of the flow or course of learning media from one slide to the next. The story-board is used to describe each slide, which includes an image display, conversation bubbles, and other pertinent information (Herbst et al., 2014; Jones, 2008; Webel & Conner, 2017). The results of this stage are displayed in the interface. This design stage went through several revisions based on the validator's direction and input before becoming a complete media design. Following the results of the tests, the media design underwent at least two improvements to produce a product ready for testing.

During the development stage, researchers create the necessary learning media elements, such as text, images, videos, and materials, into a complete media that is ready to use. After the product is completed, it is validated by experts, including material experts, media experts, and math teachers. The validation process is carried out because it can help to improve the developed media (Fahmi et al., 2019; Nurwijayanti et al., 2019; Suarsana et al., 2018). Validation is based on an evaluation of the feasibility of linguistic aspects, evaluation of effects for learning strategies, evaluation of visual aspects, evaluation of material relevance aspects, evaluation of material organization aspects, and evaluation of evaluation aspects in the form of tests (Hidayat et al., 2022; Kurniansyah et al., 2022).

The implementation stage is a full learning experiment. At this point, it is clear that students who study with android application media have better mathematical critical thinking skills than students who do not study with android application media. One of the most significant reasons is that students' learning processes are more flexible. Students can study whenever and wherever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections. This is consistent with Kurniansyah et al. (2022) belief that interesting and interactive learning media can increase students' learning motivation.

The evaluation stage results indicate that the development of this android application medium is not only recommended for trigonometry material but also materials with a connection to trigonometry, such as calculus. This is because learning mathematics is interconnected with other subjects. If students have mastered the prerequisite material's mathematical critical thinking skills, then mastering the next material's mathematical critical thinking skills should not be too difficult (Lestari et al., 2021; Priatna et al., 2020; Setiana & Purwoko, 2021). Furthermore, due to the dynamic development of technology in mathematics learning, the material presented must be developed in Android application media. This is consistent with the fact that, to foster meaningful learning for students, the mathematical material developed on Android application media must also be linked to the real-life experiences that students have daily (Purwasih et al., 2020; Van Den Heuvel-Panhuizen, 2003).

5 Conclusion

The process of developing android-based learning media on trigonometry material has gone through ADDIE development procedures, namely (1) Analysis, (2) Design, (3) Development, (4) Implementation, and (5) Evaluation. The developed media have been valid and practical and have gone through product testing to see their effectiveness. The validation results obtained are 87.33%, with details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. Furthermore, the results of the practicality test on students of 81% indicate that the android-based learning media design has a strong response, so the learning media made are very practical to use.

The achievement of students' mathematical critical thinking skills who learn using android-based media is better than those who learn without using android-based media. The achievement of students' mathematical critical thinking skills, who received learning using android-based media and those who did not use android-based media, were both in the medium category.

10 **Abstract**

11 Using ICT-based interactive learning media is a learning method that strongly supports the teaching
12 and learning process for students and teachers during the COVID-19 pandemic. This ICT-based
13 learning media must be easily accessible to teachers and students, and one of the interactive media
14 that is easily accessible is android-based learning media. This development research aims to design
15 android-based learning media on valid trigonometric material and improve students' mathematical
16 critical thinking skills. This development research using the ADDIE model took 121 people
17 consisting of expert validators, user (teacher), and students. The expert validators consisted of one
18 mathematics education material expert and one ICT expert. Meanwhile, user represented by one
19 mathematics teacher were involved in validating the use of the media design. In addition, there were
20 participants from among students, which included 118 class X high school students throughout the
21 Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive
22 trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school
23 in the medium cluster. So, the reason for taking the sample represents the condition of students both
24 on the island of Java and in Indonesia. The results showed that the developed android-based learning
25 media was valid and could be used without revision with a combined percentage of 87.33%, with
26 details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at
27 86%. The results of the practicality test on students of 81% showed that the Android-based learning
28 media design had a strong response, so the learning media made were very practical to use. The
29 product test results show that the achievement of mathematical critical thinking skills of students who
30 learn to use android-based learning media is better than those who learn not to use android-based
31 learning media. ICT-based learning media support the mathematics learning process during the
32 COVID-19 pandemic. This development research aims to design android-based learning media on
33 valid trigonometric material and improve students' mathematical critical thinking skills. This
34 development research using the ADDIE model took 20 students (limited trial), 50 students (extensive
35 test), and 26 students (product trial) as subjects. The results showed that the developed android-based

learning media was valid and could be used without revision with a combined percentage of 87.33%, with details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. The results of the practicality test on students of 81% showed that the Android-based learning media design had a strong response, so the learning media made were very practical to use. The product test results show that the achievement of mathematical critical thinking skills of students who learn to use android-based learning media is better than those who learn not to use android-based learning media.

1 Introduction

The COVID-19 pandemic has forced the world of education to make maximum use of technology in the delayed learning process. Learning in mathematics that utilizes technological advances in the form of online learning can facilitate teachers and students simultaneously in delivering and obtaining subject matter (Bertram, 2020; Chai et al., 2013; Mahmud et al., 2022; Reddy et al., 2021; Su et al., 2022). One of the uses of online learning media that is currently in great demand by various groups is the use of Android on smartphones (mobile). The development of information technology has now been used in various schools to implement interactive learning media based on Android using a PC or smartphone.

The use of Android as a learning medium gets a positive response from various groups and also provides some convenience in the online learning process. Churiyah et al. (2020) recommend that there are several conveniences in android-based online learning, including for teachers that student learning outcomes can be known directly, learning activities are not limited to distance, time, and place, in the learning process, students can be accompanied by parents, students can access the network with the internet, students can take advantage of the media in their surrounding environment and have a lot of time with family. Irfan and Wulandari (2019) stated that on Android-based learning media, students can learn more easily without being limited by time and place, nor do they need to carry books. The development of learning media at this time has utilized multimedia elements that are packaged in the form of an Android application so that it can reduce student boredom in learning. However, the obstacles that often arise are not only from student factors but also from teachers and media or teaching materials that play an important role in the mastery of understanding students' prerequisite materials (Hidayat et al., 2022; Pertiwi et al., 2021; Rohaeti et al., 2019; Sulistyo & Kurniawan, 2020; Tran et al., 2020; Wijaya et al., 2020).

In addition to the benefits that are a positive impact of using Android, there are also some negative impacts that arise, including that there are still many students who do not focus on learning because they are too busy with their cellphones used for social media and also playing games (Irfan & Wulandari, 2019). In addition, there are also some groups who still have difficulty getting internet access, and there are also families who do not have mobile devices. However, the positive impacts are far greater than the negative impacts. The government has also taken measures to minimize the negative impact by providing study quota assistance and creating study groups so that students who do not yet have devices can still study by joining with friends who have mobile devices.

Android-based learning media uses cellphones as a tool to facilitate effective and efficient learning so that students may learn (Martono & Nurhayati, 2014; Novaliendry et al., 2020). This is due to the Linux-based Android operating system for mobile devices, including smartphones and tablet computers, which Google and the Open Handset Alliance developed. Android is intended to be an operating system that offers developers an open-source platform to build applications (Hakky et al., 2018; Irfan & Wulandari, 2019; Sari & Wati, 2020). Since smartphones and tablets may be used as

learning aids anytime, anywhere, and with a high level of practicality, attractiveness, efficacy, and efficiency, android-based learning media is a learning medium.

Irfan and Wulandari (2019) note that the eligibility criteria for android-based learning media are categorized into two aspects, namely content or material aspects and media aspects. Aspects of the material can be viewed in terms of suitability, quality of content and objectives, and instructional quality. The media aspect can be viewed in terms of ease of use and navigation, in terms of aesthetics or beauty, in terms of media integration, and in terms of technical quality. While the criteria for android learning media, according to Sari and Wati (2020), are carried out based on student questionnaires with several aspects as follows: (1) Practical aspects; (2) Aspects of visual appearance; (3) language aspect; and (4) Aspects of effects for learning strategies. Meanwhile, according to Hakky et al. (2018), the eligibility criteria for android-based learning media are divided into two, namely material assessment and media assessment. The assessment of a piece of content takes into some factors, including: (1) the relevance of the content; (2) the structure of the content; (3) the evaluation and practice questions; (4) the linguistic element; (5) the effects on learning techniques; and (6) the visual appeal. The media evaluation also takes into account: (1) language features; (2) effects on learning techniques; (3) factors of software engineering; and (4) aspects of aesthetic appeal. While evaluating student responses, considerations for both learning methodologies and visual appeal are taken into account.

The eligibility criteria for the Android-based learning media used are similar, then the researchers used three criteria: material criteria, media criteria, and student response questionnaires. The material assessment criteria are divided into several categories: (1) the material's relevance; (2) its organization; (3) evaluation and practice questions; (4) the language aspect; (5) the effects on learning strategies; and (6) its visual appearance. Language aspects, effects for learning strategies, software engineering aspects, and visual appearance aspects are all included in media evaluation. The following topics are covered in student response questionnaires: (1) practical aspects, (2) visual appearance aspects, (3) language aspects, and (4) effects on learning strategies.

Trigonometry is one of the mathematical topics that can help you develop more mathematical skills (Basir & Maharanib, 2018; Wijaya et al., 2020). Furthermore, trigonometrical material is used in many other fields of science, such as architecture, navigation, engineering, studying the motion of celestial bodies such as the sun, moon, and stars and their calculations, and several other branches of physics (Basir & Maharanib, 2018; Purwanti, 2017). There are so many roles for this trigonometry material that it is critical that students understand it at the high school level and even higher, namely in college, where trigonometry material appears frequently and becomes one of the requirements for graduation.

Trigonometry's importance is still not balanced with students' mathematical critical thinking skills. Higher-order thinking skills in mathematics are expected to be important learning outcomes (Abdullah et al., 2016; Hendriana et al., 2022; Kurniati et al., 2015; Lewis & Smith, 1993; Zetriuslita & Ariawan, 2021). The ability to solve non-routine problems is defined as critical thinking (Kurniati & As'ari, 2019; Mogari & Chirove, 2017; Sari & Hidayat, 2019). Thus, critical thinking skills can be defined as logical thinking that is reasoned and focused on solving mathematical problems (Lewis & Smith, 1993; Paul & Elder, 2019; Widyatiningtyas et al., 2015). Thus, mathematical critical thinking ability is a systematic ability that can be used to solve mathematical problems by combining prior knowledge with mathematical reasoning abilities.

However, in reality, mathematics learning activities in Indonesia have not fully trained students' critical thinking skills. This can be proven from several times the results of the Trends in International Mathematics and Science Study (TIMSS) with high-level cognitive questions that measure critical thinking skills. In the 2015 TIMSS, Indonesia was ranked 46th out of 51 countries with a score of 397 (Safari, 2021). Then in the 2018 Program for International Student Assessment (PISA) results, it shows that Indonesia's achievement in mathematics has a score of 379 which indicates a decrease of 7 points from that obtained in 2015 (Setiawan et al., 2021). This concludes that the improvement of students' mathematical critical thinking skills still needs to be improved

Student's difficulties in learning trigonometry during the COVID-19 pandemic make it urgent to research teaching media development. In this case, the researcher studied the effect of android-based learning media on trigonometry material to improve students' mathematical critical thinking skills. This research is expected to produce a valid product about android-based learning media in trigonometry material. In addition, the resulting product can also meet practical aspects so that it can be widely applied in learning.

Aside from the above study, the authors want to see how much Android-based trigonometry learning media is expected to improve students' mathematical critical thinking skills during the COVID-19 pandemic. This study aims to analyze and investigate: (1) the process of developing android-based learning media on trigonometric material; and (2) the results of the application of android-based trigonometry learning in improving students' mathematical critical thinking skills. Aside from the above study, the authors want to see how much Android-based trigonometry learning media is expected to improve students' mathematical critical thinking skills during the COVID-19 pandemic. The purpose of this study is to analyze and investigate: (1) the development of android-based learning media on trigonometry materials; and (2) the outcomes of implementing android-based trigonometry learning to improve students' mathematical critical thinking skills.

2 Research Methods

The ADDIE (Analysis, Design, Development, Implementation, and Evaluation) model is used in this development research to create android-based learning media on trigonometry material to improve students' mathematical critical thinking skills during the COVID-19 pandemic. Figure 1 depicts the stages of the ADDIE development model.

Participants involved in developing the implementation of this android-based learning media product amounted to 121 people, expert validators, the user (teacher), and students. The expert validators consisted of one material expert in the field of mathematics education (Dr. Sri Adi Widodo, M.Pd, lecturer at the Universitas Sarjanawiyata Tamansiswa, Yogyakarta, Indonesia) and one ICT expert (Dr. Surya Amami Pramuditya, M.Sc, Head of Media and Learning Device Development at the Universitas Swadaya Gunung Jati, Cirebon, Indonesia). Meanwhile, the user represented by one of the mathematics teachers (Agie Ginarnjar, S.Pd, Guru SMA Negeri 2 Padalarang, West Java, Indonesia) was involved in validating the use of media designs. In addition, there were participants from among students, which included 118 class X high school students throughout the Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school in the medium cluster. So, the reason for taking the sample represents the condition of students both on the island of Java and in Indonesia.

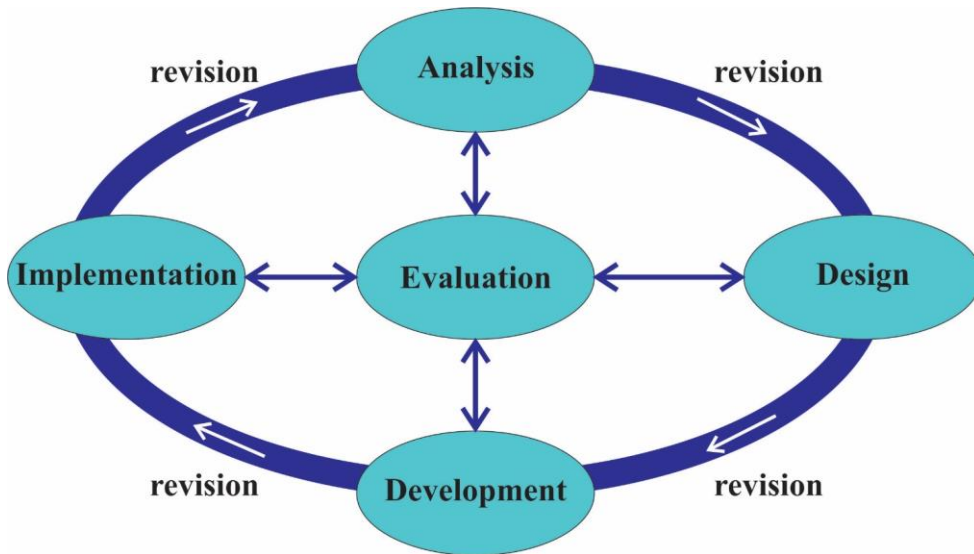

Figure 1. ADDIE development model

The subject matter of trigonometry that is used as the focus of this research is: (1) Trigonometric ratios and angle measures; (2) Special angle trigonometric ratio; (3) Graphs of trigonometric functions; and (4) The sine, cosine, and area rules of a triangle.

Students' mathematical critical thinking ability is measured through a test with the characteristics of a good critical thinking ability test. The following is an example of a student's mathematical critical thinking ability test (see Figure 2).

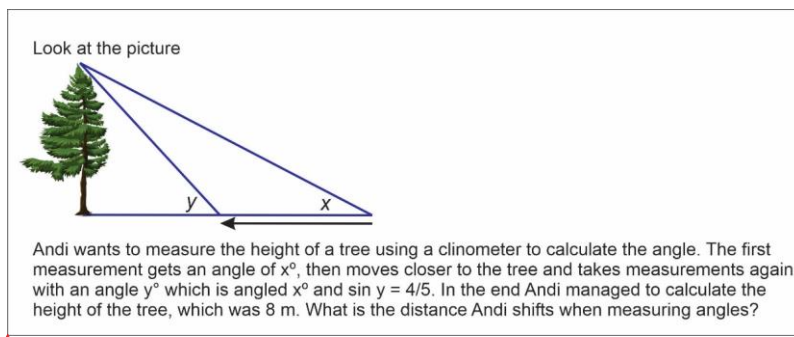

Figure 2. An example of a student's mathematical critical thinking ability test

2.1 Analysis Stage

The analysis is performed to determine the learning needs and competencies that students must master. Details of activities during the analysis stage, specifically:

- 178 a. A user needs analysis is a study that is conducted to determine what is required in the
179 development of learning media. The information was gathered through interviews with the goal
180 of eliciting information about problems encountered while learning trigonometry material.
181 b. Identification of needs (problems) seeks to discover the solutions that must be proposed in the
182 design of android-based learning media in order for students to master the competencies
183 required.

184 2.2 Design Stage

185 This stage's activities are divided into five steps, which are as follows:

- 186 a. Developing competencies, namely developing specific competencies that students must achieve
187 in designing android-based learning media, so that students can be self-sufficient (mathematical
188 critical thinking skills).
189 b. Determine the learning material, which is trigonometry in class X SMA. This material was
190 chosen to keep the discussion from becoming too broad.
191 c. The researcher creates an android-based learning media strategy to aid the learning process and
192 ensure that the predetermined competency goals are met. This product contains at least three
193 media that are combined into one, namely a Google Form, a Wizer.me interactive worksheet,
194 and an Apperception video.
195 d. Evaluation, specifically evaluating the equipment and conditions required by students in order
196 to achieve the learning competencies that are expected.
197 e. Sources, specifically locating and determining learning resources that can aid in the creation of
198 this android.

199 2.3 Development Stage

200 The development stage consists of producing or creating specifications for android-based learning
201 media that were determined during the design stage. The android-based learning media must then be
202 validated before being used in the learning process once it has been completed in production.
203 Activities carried out during the development stage include:

- 204 a. Creating learning media, specifically Android-based learning media Android-based learning
205 media is created with the PowerPoint application, which is easily accessible on a laptop.
206 Furthermore, it is converted into an application using APK Builder Pro 3.4, so that it becomes a
207 product in.html and is ready to be explored into an application that is ready to be installed.
208 making android-based learning media that is scientifically tailored to the needs of students
209 learning trigonometry material.
210 b. Validation of Learning Media, which includes expert, user, and audience validation in the form
211 of a questionnaire the validation of learning media. This validation is intended to gather
212 feedback for revising android-based learning media so that it can be said to be usable.

213 In this case, expert validation is performed by a single lecturer who is both a material expert and a
214 media expert. Mathematics teachers perform user validation, and students are tested for audience
215 validation. The validated criteria for assessment aspects include:

- 216 a. Material expert assessment: (1) aspects of material relevance; (2) aspects of material
217 organization; (3) aspects of evaluation and practice questions; (4) language aspects; (5) effects
218 of learning strategies; and (6) visual appearance.

- b. Evaluation of media experts: (1) language aspects; (2) effects on learning strategies aspects; (3) software engineering aspects; and (4) visual appearance aspects.
- c. User evaluation: (1) aspects of material relevance; (2) aspects of the material organization; (3) aspects of evaluation and practice questions; (4) language aspect; (5) effects for learning strategies; and (6) visual appearance.
- d. A student response questionnaire with three sections: (1) language aspects, (2) effects for learning strategies, and (3) visual appearance aspects.

Rubric or product development validation criteria are presented in Table 1.

Table 1. Product development validity criteria

<u>Score (%)</u>	<u>Category</u>
<u>81-100</u>	<u>Very valid</u>
<u>61-80</u>	<u>Valid</u>
<u>41-60</u>	<u>Quite valid</u>
<u>21-40</u>	<u>Invalid</u>
<u>0-20</u>	<u>Very invalid</u>

In addition to focusing on the design and manufacture of android-based learning media, at this development stage, simulations were also carried out to support the validation stage (especially the student response questionnaire). Simulations were carried out on class X SMA students in the form of a limited trial of 20 people, an extensive trial of 50 people (from two classes in two schools), and a product test of 48 people (from two classes in one school, each with 24 students). The lesson design in this study is in the form of distributing student response questionnaires that have been given simulations using android-based media that have been created. Rubric or product development practical criteria are presented in Table 2.

Table 2. Product development practical criteria

<u>Score (%)</u>	<u>Category</u>
<u>81-100</u>	<u>Very Practical</u>
<u>61-80</u>	<u>Practical</u>
<u>41-60</u>	<u>Quite of Practical</u>

<u>Score (%)</u>	<u>Category</u>
<u>21-40</u>	<u>Less Practical</u>
<u>0-20</u>	<u>Not Practical</u>

Formatted: Normal, No bullets or numbering

2.4 Implementation Stage

The implementation stage is when the mathematics teacher delivers learning material in the classroom. Material is submitted using android-based learning media that has been validated by experts, as well as a control class that does not receive media as a benchmark for evaluating material for the experimental class. The number of samples at this implementation stage was 48 from two classes (24 people each).

Experimental and control class were determined randomly, and both classes had the same ability based on the average achievement of the previous material. Before the product test was carried out, the two classes had yet to experience learning using android-based media.

One of the objectives of this research is to improve students' mathematical critical thinking skills using android-based learning media that has been developed. Therefore, a mathematical critical thinking ability test was conducted at the end of the lesson. The results were analyzed using a statistical test, the independent sample t-test, using JASP Statistics software. The implementation stage is the stage in which the mathematics teacher delivers learning material in the classroom. Material is submitted using android-based learning media that has been validated by experts, as well as a control class that does not receive media as a benchmark for evaluating material for the experimental class.

2.5 Evaluation Stage

The evaluation was carried out to determine the quality of the finished products, which were android-based learning media. This level of quality will be evident if android-based learning media can improve students' mathematical critical thinking skills both before and after learning. In this step, the researcher classified the data to improve students' mathematical critical thinking skills, which would be measured using test questions administered at the beginning and end of the lesson. If students' mathematical critical thinking skills improve, learning with android-based learning media is considered successful; however, if there is no improvement or a decrease, the developed android-based learning media must be improved. Figure 2-3 depicts the entire flow of research and development activities.

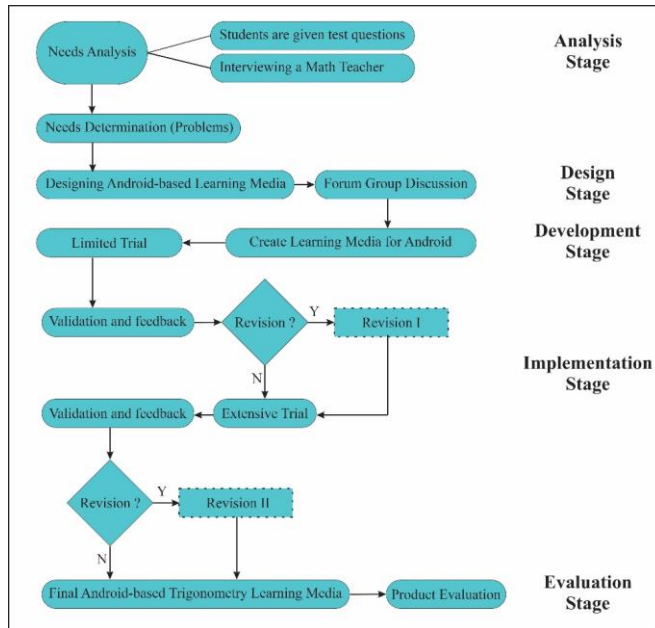

Figure 23. Flow of research and development activities

3 Results

This development produced learning media in the form of Android applications based on Trigonometry material. The resulting application is a file with an.apk extension that is installed on an Android smartphone. PowerPoint is used as a medium for application development, which is then exported into an application using Website 2 APK Builder Pro 3.4. It also makes use of several supporting applications, such as g-form, interactive worksheets, and interactive videos, to create self-contained applications that teachers, students, and parents can easily control. The outcomes of the development stages used in the ADDIE development model (Analysis, Design, Development, Implementation, and Evaluation).

3.1 Analysis Stage

The following steps are required to determine the initial needs for developing learning media: (1) User Needs Analysis, (2) Student Learning Style Analysis, and (3) Curriculum or Content Analysis. Before moving on to the user requirements analysis stage, the problem is identified and the required solution is determined. Based on observations of classroom learning, student interviews, discussions with mathematics teachers, and readings from various articles, problems were identified, including students' basic mathematical abilities and lack of interest. This is caused by a number of things, including the lack of independent learning media, a lack of innovation and variety in the use of media, and a lack of use of Android devices as learning tools. Making learning media can be used to solve previous issues.

The need for the product is determined by analyzing user needs. Table 4-3 shows the data from observations and interviews used to determine needs.

Table 4.3. Observational and interview-based data

Evidenced	Analysis Findings
Examined subjects	Trigonometry
The learning procedure	Describe with examples, practice, and homework
Books or other educational resources are accessible.	Some textbooks can only be used at school; however, due to limited availability, not everyone can borrow textbooks from school.
The caliber of learning media	Still limited to powerpoint slides, which are rarely used. Furthermore, the media has not changed.
Student Situation	Difficulty understanding the material and requiring the teacher to explain it repeatedly; difficulty finding reference sources; and difficulty completing assignments
Teacher limitations in the classroom	Due to the perceived difficulty of the material, the inability of students to interact face-to-face due to the pandemic, and the short study periods at school, students lack the motivation to learn.
Students' technology as a source of independent learning	Some students have computers, but many more have Android smartphones that are underutilized.
Required media	Attendance, materials, videos to clarify the material, examples, and practice questions with discussion, as well as media that can be used for learning at home, are examples of media that can attract students' interest and attention.

The findings of the observations and interviews are then analyzed to determine user needs, which are supported by the specifications/features of learning media (see Table 4.4).

Table 4.4. Results of user need analysis

Requirement	Analysis Findings
User Aims	SMA/MA/SMK students in Class X

Requirement	Analysis Findings
Learning Media Categories	Trigonometry learning media takes the form of an app that can be downloaded and installed on an Android smartphone for independent study.
Features that are required	1. Instructions for use 2. Contains fundamental competencies and learning objectives 3. There is an email-synchronized attendance list link (g-from) 4. Displaying materials and examples 5. Available instructional videos (edpuzels) 6. There are practice questions and discussions (wizer.me) 7. Developers' page for applications.

294 The analysis results related to the required features and content (see Table 2) must have the
 295 characteristics of learning media to produce a good display. This media development incorporates
 296 Alessi and Trollip's (Alessi & Trollip, 2000) media characteristics, namely: (a) introduction to
 297 learning media; (b) student control; (c) consistency; and (d) presentation mode. The start page in the
 298 form of the media title and developer identity marks the beginning. A login button is presented so
 299 that users can proceed to the next page. Student control allows users to interact with learning media.
 300 Control is accomplished through the use of specific buttons, namely menu and navigation buttons. In
 301 learning media, menu buttons include buttons for various menu options. Navigation buttons are used
 302 to move to specific pages, such as (1) Home, which takes you to the main page of learning media, (2)
 303 Next, which takes you to the next page, and (3) Back, which takes you back to the previous page.
 304 The goal of consistency is to make learning media more convenient for users. The following
 305 components have consistency applied to them: (1) putting the home, next, and back buttons at the
 306 bottom; (2) using consistent keys for the same purpose; (3) using consistent paragraphs, font sizes,
 307 and font types in the text; and (4) using a consistent color for one-way sections. while the
 308 presentation mode depicts the presentation of content in accordance with the requirements of visual
 309 elements, namely: 1) readability of media text, where learning is developed using clear and easy-to-
 310 read text. The font used is Maiandra GD, which is a suitable size and easy to read. Furthermore, the
 311 text color is adjusted to match the background color so that the text is legible. 2) Graphic quality is
 312 used in a display that is arranged with artistic quality and attractiveness. A good color element is
 313 presented with a maximum of five color shades. 3) Video quality The video in this lesson is used to
 314 visualize the material through various examples from everyday life.

315 The next step is to analyze student learning styles after identifying user needs. This analysis is useful
 316 in determining what type of media will be created to suit students' learning styles in order to improve
 317 students' learning motivation. Table 3-5 shows the results of the analysis of student learning styles.

318 **Table 3-5.** Analysis of student learning styles

Analysis Findings
Students prefer to learn in a relaxed and enjoyable environment, free of stress, with opportunities for observation, practice, and discussion.

Analysis Findings

To discover the benefits of everyday learning, it is necessary to alternate between calculations and practice.

Use of educational games to assess practice questions

At the curriculum analysis or content stage, namely material relevant to the specified basic competencies. According to the syllabus, basic competencies and objectives/indicators are required for developing trigonometry learning media. Angle measures and trigonometric ratios, trigonometric ratios of special angles, graphs of trigonometric functions, rules of sin, cos, and area of triangles, and functions of trigonometric equations are all organized around these fundamental competencies. At this stage, the material compiled is guided by a variety of sources, including books, modules, and other supporting materials.

Other content that will be included in the learning media, such as videos, examples, and practice questions, must be determined in advance, in addition to the material. The videos created in this application are in the form of light videos at the beginning of learning that contains illustrations and examples of the application of trigonometry material to daily activities, and several videos are also given as examples of problem-solving. Practice questions are presented in wizer.me interactive worksheets to facilitate student work and teacher correction, and can be emailed to parents.

3.2 Design Stage

The design phase produces a flowchart that describes the sequence and structure of learning media, a storyboard with a template design plan, and an interface design. The created flowchart is then used as a guide for designing storyboards, resulting in a planning design that is in accordance with the media structure (see Figure 34).

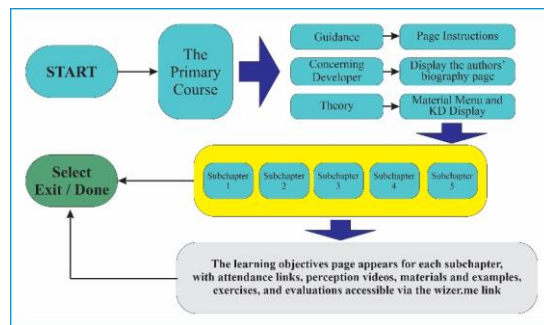

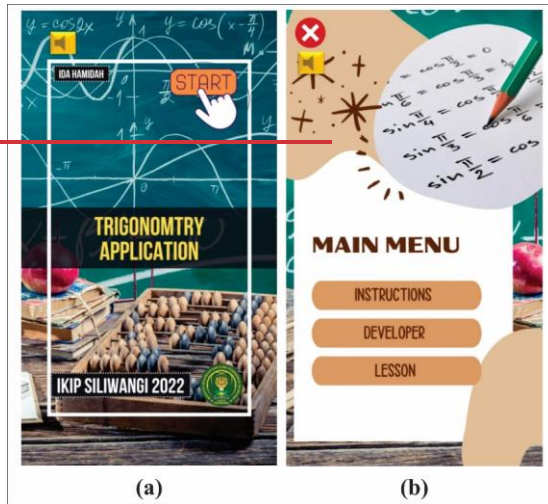

Figure 34. Flowchart of media structure

The storyboard is a rough outline of the display of the learning media that will be created, including the media's content, layout, and the majority of the elements that will be included (Herbst et al., 2014; Jones, 2008; Webel & Conner, 2017). The story-board is then used as a guide in creating the interface design. The interface design creates a real storyboard representation by paying attention to the previously analyzed elements and characteristics of the learning media, such as balance, color, text, graphics, and others (see Figure 45a). The storyboard design is then translated into a real display

345 or interface design to make it more appealing and user-friendly (see Figure 5b). Furthermore, each
346 resource includes information on learning objectives and attendance links (see Figures 5c and 5d).

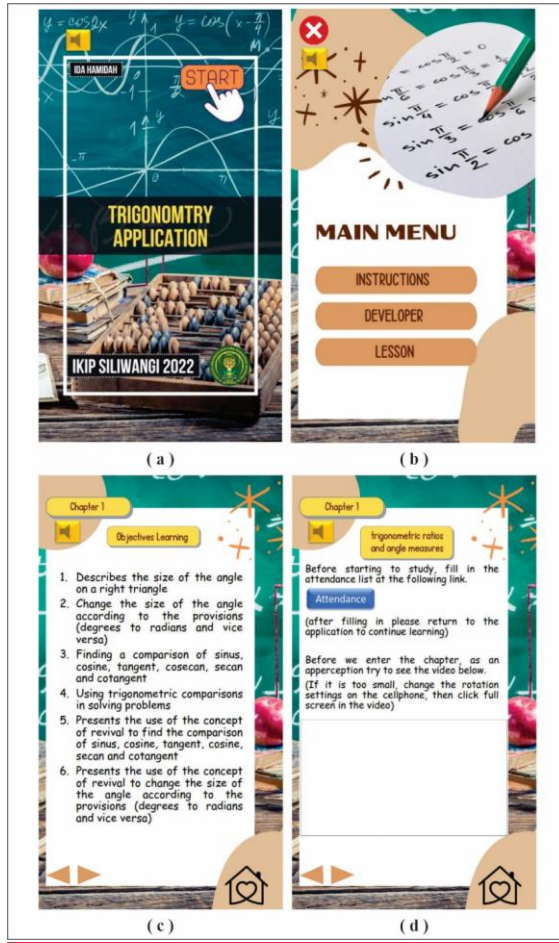

Figure 4.5. Interface design a) homepage and b) default menu page, c) learning goals, and d) attendance links

The storyboard design is then translated into a real display or interface design to make it more appealing and user-friendly (see Figure 4). Furthermore, each resource includes information on learning objectives and attendance links (see Figure 5).

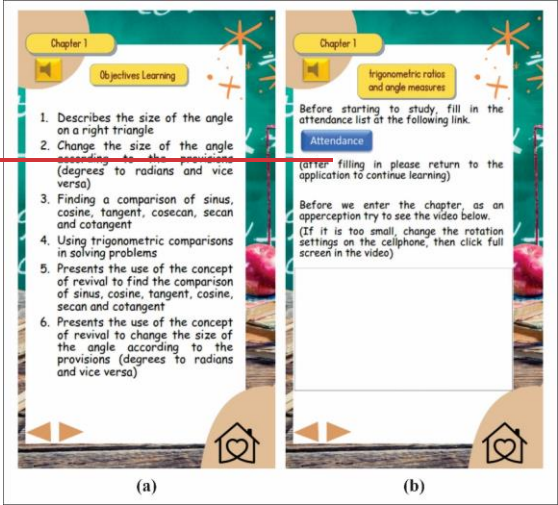

Figure 5. Interface design a) learning goals and b) attendance links

Exercises are also presented as a worksheet on each material page (see Figure 66). It is intended to continue to hone students' mathematical critical thinking abilities.

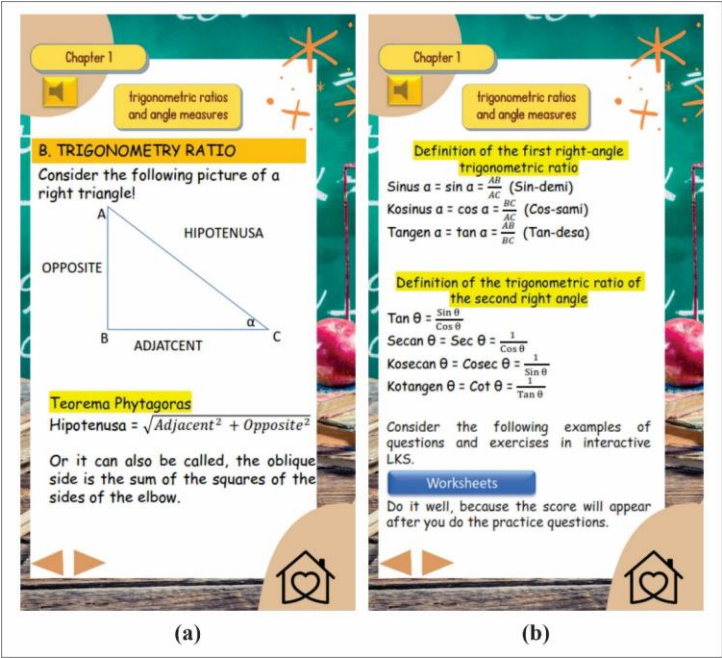

Figure 66. Worksheets and resource pages

3.3 Development Stage

Development is the stage of product development and testing in which the results of the analysis, and design are transformed into a complete finished product and validated by experts, specifically material and media experts. In addition to validation, the developer requests feedback and suggestions from expert validators in order to improve the developed media.

3.3.1 Making Educational Media

This android-based learning media is created in PowerPoint, which is then converted into an html file product by APK Builder Pro 3.4 and is ready to be explored into an application that is ready to be installed.

3.3.2 Learning Media Validation

Experts validate learning media (material experts, media experts, and users). Dr. Sri Adi Widodo, M.Pd. is the material's validator (Lecturer of Mathematics Education, Universitas Sarjanawiyata Tamansiswa Yogyakarta, Indonesia). Users validate the development of learning media, in addition to material experts and media experts. Agie Ginanjar, S.Pd., is a mathematics teacher at SMA Negeri 2 Padalarang in West Bandung, Indonesia. Table 6 shows the results of material and user/teacher validation. Experts validate learning media (material experts, media experts, and users). Dr. Sri Adi Widodo, M.Pd. is the material's validator (Lecturer of Mathematics Education, Universitas Sarjanawiyata Tamansiswa Yogyakarta, Indonesia). Table 4 shows the results of material validation.

Table 46. Material expert and math user/teacher validation results are recapitulated. Material experts' validation results are recapitulated

Indicator	Score	Levels of Validation
Language Aspect Eligibility Evaluation	100%	Extremely valid

1	Material Expertise			
2	Media Specialists	87.33%	Extremely valid	Unrevised use is possible
3	User			

3.3.3 Simulation

The simulation was performed on class X high school students in the form of a limited trial of 20 people, a extensive trial of 50 people (from two classes in two schools), and a product test of 48 people (from two classes in one school, each with 24 students). The lesson design in this study takes the form of distributing student response questionnaires that have been given simulations using created android-based media. Table 8 summarizes the results of limited trials, extensive trials, and product trials. The simulation was performed on class X high school students in the form of a limited trial of 20 people, a extensive trial of 50 people (from two classes in two schools), and a product test of 26 people. The lesson design in this study takes the form of distributing student response questionnaires that have been given simulations using created android-based media. Table 8 summarizes the results of limited trials, extensive trials, and product trials.

Table 8. Recapitulation of student response results

Indicators	Limited Trial		Extensive Trial		Product Test	
Language Aspect Eligibility Evaluation	85%	very strong	78%	strong	80%	strong

Indicators	Limited Trial		Extensive Trial		Product Test	
Evaluation of Learning Strategies' Effects	87%	strong	76%	strong	82%	strong
Visual Evaluation	83%	strong	76%	strong	81%	strong
TOTAL	85%	very strong	77%	strong	81%	strong
Criteria				Usefull for learning		

With a response score of 81%, the analysis of student response results revealed a strong interpretation (see Table 8). This demonstrates that students feel helped in increasing mathematical critical thinking skills after receiving android-based learning media on trigonometry material. Furthermore, the developed product or media has been declared valid and can be used for learning (see Table 8).

3.4 Implementation Stage

Experiments were conducted on students from two classes in one school, each with 24 students. The first class is known as the experimental class, and the second is the control class. The experimental class consists of students who learn using the developed Android application media, while the control class consists of students who learn without using the developed Android application media.

Based on the assumption test analysis using JASP Statistics software, it is found that the data is normally distributed and has a homogeneous variance. This is followed by a parametric test, namely the independent sample t-test (see Table 9).~~Experiments were conducted on students from two classes in one school, each with 24 students. The first class is known as the experimental class, and the second is the control class. The experimental class consists of students who learn using the developed Android application media, while the control class consists of students who learn without using the developed Android application media. Based on the assumption test analysis using JASP Statistics software, it is found that the data is normally distributed and has a homogeneous variance. This is followed by a parametric test, namely the independent sample t-test (see Table 9).~~

Table 9. Independent sample t-test (one-tailed)

Data	t-value	df	P-value
Score of Mathematical Critical Thinking	2.538	46	0.007

The P-value from the independent sample t-test results (see Table 9) is 0.07. As a result, those who learn using the developed android application media have better mathematical critical thinking skills than those who do not learn using the developed android application media.

3.5 Evaluation Stage

The ADDIE model's final stage is evaluation. The researcher solicited responses from students who had studied with the developed Android application media during this stage of evaluation. Each action elicits a variety of reactions, both positive and negative. The most common positive response is that students' learning processes are more flexible. Students can study wherever and whenever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections.

In addition to positive responses, there are negative responses that necessitate improvements in the developed Android application media. This is because life is never static; it is constantly changing and improving with each stage. The negative response, in the form of criticism and constructive suggestions, is that not all students have access to a cellphone with the most recent version as a device for using android application media in learning mathematics. So, in line with the research of Hapsari and Fahmi (2021), the researchers intend to carry out further development of this application, and the responses and suggestions obtained during the study were used as a reference for improvement.

4 Discussion

The findings of a study on the development of learning media with Android applications show that students' mathematical critical thinking skills improve. Furthermore, the interaction between learning resources and students, learning through Android application media can increase student interest in learning (Sari & Wati, 2020). This android application begins by creating learning media with Microsoft Power-Point, which is then enhanced with I-Spring and Website 2 APK Builder. This demonstrates the advantages that students gain from the learning process, which is simple to create, free, and not overly demanding.

This android learning media also makes use of other applications in its development, such as Google Forms and Wizer.me. This is thought to make it easier for students and teachers to conduct online learning in the form of worksheets, attendance lists, and learning evaluations that parents can access. It is hoped that by using interactive worksheets, students' mathematical abilities will improve (Kurniansyah et al., 2022; Pertiwi et al., 2021).

The created media summarizes trigonometry material with a scientific approach to help students improve their mathematical critical thinking skills. This media is developed in stages to produce learning media products that are suitable for use in the learning process. Several needs analyses were performed in the first stage of the development of the developed product, which included three types of analyses: user needs analysis, student learning style analysis, and curriculum analysis (Fahmi et al., 2019; Marbán & Mulenga, 2019). This can be determined during the preliminary observations. The following analysis is to determine the theme and scope of the learning media so that the media developed is limited. The following analysis is to determine the theme and scope of the learning media so that the media developed is limited. This stage is completed by paying close attention to the material being created.

At the design stage, the goal is to sketch out the content of the android media, which is created with student characteristics in mind. Flowcharts, storyboards, and user interfaces are then created. Flowcharts are created to provide a high-level over-view of the flow or course of learning media from one slide to the next. The story-board is used to describe each slide, which includes an image display, conversation bubbles, and other pertinent information (Herbst et al., 2014; Jones, 2008; Webel & Conner, 2017). The results of this stage are displayed in the interface. This design stage went through several revisions based on the validator's direction and input before becoming a complete media design. Following the results of the tests, the media design underwent at least two improvements to produce a product ready for testing.

During the development stage, researchers create the necessary learning media elements, such as text, images, videos, and materials, into a complete media that is ready to use. After the product is completed, it is validated by experts, including material experts, media experts, and math teachers. The validation process is carried out because it can help to improve the developed media (Fahmi et al., 2019; Nurwijayanti et al., 2019; Suarsana et al., 2018). Validation is based on an evaluation of the feasibility of linguistic aspects, evaluation of effects for learning strategies, evaluation of visual aspects, evaluation of material relevance aspects, evaluation of material organization aspects, and evaluation of evaluation aspects in the form of tests (Hidayat et al., 2022; Kurniansyah et al., 2022).

~~The implementation stage is a full learning experiment. At this point, it is clear that students who study with android application media have better mathematical critical thinking skills than students who do not study with android application media. One of the most significant reasons is that students' learning processes are more flexible. Students can study whenever and wherever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections. This is consistent with Kurniansyah et al. (2022) belief that interesting and interactive learning media can increase students' learning motivation.~~

The evaluation stage results indicate that the development of this android application medium is not only recommended for trigonometry material but also materials with a connection to trigonometry, such as calculus. This is because learning mathematics is interconnected with other subjects. If students have mastered the prerequisite material's mathematical critical thinking skills, then mastering the next material's mathematical critical thinking skills should not be too difficult (Lestari et al., 2021; Priatna et al., 2020; Setiana & Purwoko, 2021). Furthermore, due to the dynamic development of technology in mathematics learning, the material presented must be developed in Android application media. This is consistent with the fact that, to foster meaningful learning for students, the mathematical material developed on Android application media must also be linked to the real-life experiences that students have daily (Purwasih et al., 2020; Van Den Heuvel-Panhuizen, 2003).

5 Conclusion

The process of developing android-based learning media on trigonometry material has gone through ADDIE development procedures, namely (1) Analysis, (2) Design, (3) Development, (4) Implementation, and (5) Evaluation. The developed media have been valid and practical and have gone through product testing to see their effectiveness. The validation results obtained are 87.33%, with details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. Furthermore, the results of the practicality test on students of 81% indicate that the android-based learning media design has a strong response, so the learning media made are very practical to use.

The achievement of students' mathematical critical thinking skills who learn using android-based media is better than those who learn without using android-based media. The achievement of students' mathematical critical thinking skills, who received learning using android-based media and those who did not use android-based media, were both in the medium category.

Research on developing android-based learning media still needs to be improved in trigonometry material and mathematical critical thinking skills. For further study, it is expected to be able to examine further the difficulties faced by students in improving other higher-order thinking skills. The process of developing android-based learning media on trigonometry material has gone through ADDIE development procedures, namely (1) Analysis, (2) Design, (3) Development, (4) Implementation, and (5) Evaluation. The developed media have been valid and practical and have gone through product testing to see their effectiveness. The achievement of students' mathematical critical thinking skills who learn using android-based media is better than those who learn without using android-based media. The achievement of students' mathematical critical thinking skills, who received learning using android-based media and those who did not use android-based media, were both in the medium category.

Dear Dr Hidayat,

Frontiers Education Editorial Office has sent you a message. Please click 'Reply' to send a direct response

I am pleased to inform you that your manuscript "How can Android-based Trigonometry Learning improve the math learning process?" has been approved for production and accepted for publication in Frontiers in Education, section Digital Learning Innovations. Proofs are being prepared for you to verify before publication. We will also perform final checks to ensure your manuscript meets our criteria for publication (<https://www.frontiersin.org/about/review-system#ManuscriptQualityStandards>)

The title, abstract and author(s) list you provided during submission is currently online and will be replaced with the final version when your article is published. Please do not communicate any changes until you receive your proofs.

Any questions? Please visit our Production Help Center page for more information: <https://zendesk.frontiersin.org/hc/en-us/categories/200397292-Article-Production->

You can click here to access the final review reports and manuscript: <http://www.frontiersin.org/Review/EnterReviewForum.aspx?activationno=079bc228-b17e-404b-a9eb-0162b8ad57bc>

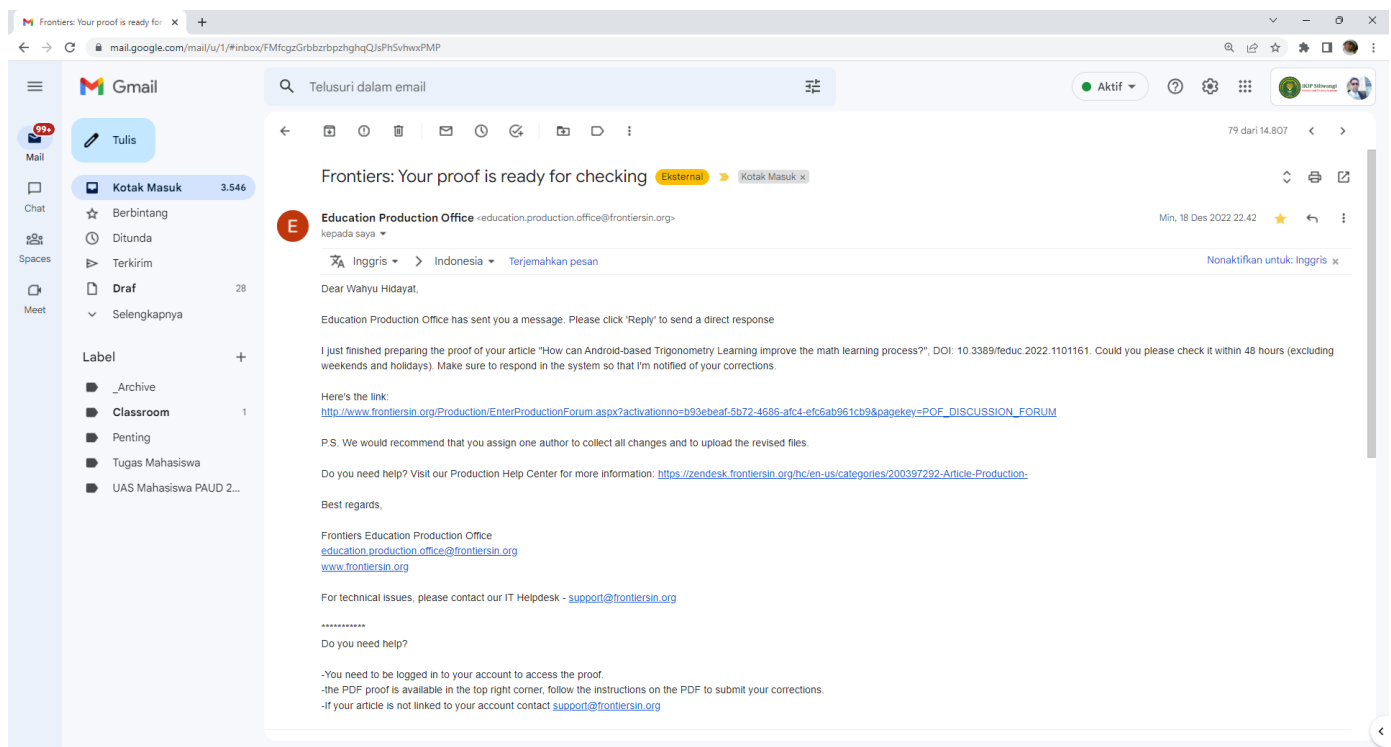

As an author, it is important that you keep your Frontiers research network (Loop) profile up to date, so that you and your publications are more discoverable. You can update your profile pages (profile picture, short bio, list of publications) using this link: <https://loop.frontiersin.org/people/>

Best regards,

Your Frontiers in Education team

Proofread Ready for Checking Final Manuscript (Tanggal 18 Desember 2022)

Proofread Correction

Final Manuscript

(Tanggal 19 Desember 2022)

Author's Proof

Before checking your proof, **please see the instructions below**.

- Carefully read the entire proof and mark all corrections in the appropriate place, using the Adobe Reader commenting tools ([Adobe Help](#)).
- Provide your corrections in a single PDF file or post your comments in the Production Forum making sure to reference the relevant query/line number. Upload or post all your corrections directly in the Production Forum to avoid any comments being missed.
- We do not accept corrections in the form of edited manuscripts nor via email.
- Do not provide scanned, handwritten corrections.
- Before you submit your corrections, please make sure that you have checked your proof carefully as once you approve it, you won't be able to make any further corrections.
- To ensure the timely publication of your article, please submit the corrections within 48 hours. After submitting, do not email or query asking for confirmation of receipt.

Do you need help? Visit our [Production Help Center](#) for more information. If you can't find an answer to your question, contact your Production team directly by posting in the Production Forum.

Quick checklist

- ☐ **Author names** - Complete, accurate and consistent with your previous publications.
- ☐ **Affiliations** - Complete and accurate. Follow this style when applicable: Department, Institute, University, City, Country.
- ☐ **Tables** - Make sure our formatting style did not change the meaning/alignment of your Tables.
- ☐ **Figures** - Make sure we are using the latest versions.
- ☐ **Funding and Acknowledgments** - List all relevant funders and acknowledgments.
- ☐ **Conflict of Interest** - Ensure any relevant conflicts are declared.
- ☐ **Supplementary files** - Ensure the latest files are published and that no line numbers and tracked changes are visible. Also, the supplementary files should be cited in the article body text.
- ☐ **Queries** - Reply to all typesetters queries below.
- ☐ **Content** - Read all content carefully and ensure any necessary corrections are made.

Author queries form

Query No.	Details Required	Author's Response
Q1	The citation and surnames of all of the authors have been highlighted. Check that they are correct and consistent with your previous publications, and correct them if needed. Please note that this may affect the indexing of your article in repositories such as PubMed. If adding/removing authors, or changing the order of this list, please provide us with a signed Authorship Change form .	Correct
Q2	Confirm whether the article title is correct.	Correct
Q3	If the following authors would like their LOOP profile to be linked to the final published version, ensure that they (at register) with Frontiers at the provided link, and provide us with the URLs to their profile(s). Non-registered authors and authors with profiles set to "Private" will have the default profile image displayed. Note that we will not be able to add profile links after publication. "Euis Eti Rohaeti" "Ida Hamidah"	Euis Eti Rohaeti: https://loop.frontiersin.org/people/2039121/overview Ida Hamidah: https://loop.frontiersin.org/people/2145209/overview

Query No.	Details Required	Author's Response
Q4	Confirm that all author affiliations are correctly listed. Per our style guidelines, affiliations are listed sequentially and follow author order. Requests for non-sequential affiliation listing will not be fulfilled. Note that affiliations should reflect those at the time during which the work was undertaken. If adding new affiliations, specify if these should be listed as a present address instead of a regular affiliation.	Correct
Q5	Confirm that the email address in your correspondence section is accurate. Any changes to corresponding authors requires individual confirmation from all original and added/removed corresponding authors.	Correct
Q6	The abstract should ideally be structured according to the IMRaD format (Introduction, Methods, Results and Discussion). Provide a structured abstract if possible.	Correct
Q7	Confirm that the keywords are correct, and keep them to a maximum of eight and a minimum of five. (Note: a keyword can be made up of one or more words.)	Correct
Q8	Check if the section headers (i.e., section leveling) have been correctly captured.	Correct
Q9	Check that all equations and special characters are displayed correctly.	on page 9 (line 943): the p-value written is 0.07, it should be 0.007
Q10	Add the following references in the Reference List. "Safari, 2021."	Safari, N. F. N. (2021). Mathematics make students confused and anxious: A comparisons between Australia, Indonesia, and Singapore in the 2015 TIMSS. Indonesian Journal of Educational Assessment, 3(2), 1-15. We created and design the figures by ourselves
Q11	If you decide to use previously published, copyrighted figures in your article, please keep in mind that it is your responsibility, as the author, to obtain the appropriate permissions and licenses and to follow any citation instructions requested by third-party rights holders. If obtaining the reproduction rights involves the payment of a fee, these charges are to be paid by the authors.	
Q12	Ensure that all the figures, tables, and captions are correct, and that all figures are of the highest quality/resolution. If necessary, you may upload improved figures to the Production Forum. Please note that figures and tables must be cited sequentially, per section 2.2 of the author guidelines .	Correct
Q13	The image used in Figure 6 has part labels; however, the part labels are missing in the caption. Please either provide a revised figure or modify the caption, as necessary.	Figure 6 is a single unit (without Labels A and B) with the description: Worksheets and resource page. Figure 6 has been corrected and re-uploaded.
Q14	Confirm that the Data Availability statement is accurate. Note that this statement may have been amended to adhere to our Publication Ethics guidelines.	Confirm
Q15	If your article requires an Ethics statement, please confirm that the statement in this proof is correct. If this is not the latest version, please provide a revised Ethics statement. If your article contains identifiable human images, please check our Policies and Publication Ethics here .	Correct
Q16	Confirm that the details in the "Author Contributions" section are correct. We have added the sentence "All authors contributed to the article and approved the submitted version."	Correct

Query No.	Details Required	Author's Response
Q17	Ensure all grant numbers and funding information are included and accurate (after publication it is not possible to change this information). All funders should be credited, and all grant numbers should be correctly included in this section.	Correct
Q18	Confirm if the text included in the Conflict of Interest statement is correct. Please do not suggest edits to the wording of the final sentence, as this is standard for Frontiers' journal style.	Correct
Q19	Provide the DOI for "Basir and Maharani, 2018, Chai et al., 2013, Hapsari and Fahmi, 2021, Herbst et al., 2014, Martono and Nurhayati, 2014, Novaliendry et al., 2020, Purwanti, 2017 if applicable."	All citation references do not have an active DOI Alessi, S. M., & Trollip, S. R. (2000). Interactive multimedia: Tools for learning and instruction. New York: Allyn & Bacon. Purwasih, R., Santana, F., & Aripin, U. (2020). Realistic mathematics worksheet for elementary school teachers: A training for learning. In Ashadi., J. Priyana, Basikin., A. Triastuti, & N. H. P. S. Putro (Eds.), Teacher Education and Professional Development in Industry 4.0 (pp. 178-182). CRC Press.
Q20	Provide publisher details for "Alessi and Trollip, 2000."	
Q21	Provide the editor name(s) for "Purwasih et al., 2020."

How can android-based trigonometry learning improve the math learning process?

Wahyu Hidayat^{1*}, Euis Eti Rohaeti¹, Ida Hamidah² and Ratu Ilma Indra Putri³

¹Department of Mathematics Education, IKIP Siliwangi, Cimahi, West Java, Indonesia, ²Department of Tadris Mathematics, STAI Al-Bahjah, Cirebon, West Java, Indonesia, ³Department of Mathematics Education, Universitas Sriwijaya, Palembang, South Sumatra, Indonesia

Using ICT-based interactive learning media is a learning method that strongly supports the teaching and learning process for students and teachers during the COVID-19 pandemic. This ICT-based learning media must be easily accessible to teachers and students, and one of the interactive media that is easily accessible is android-based learning media. This development research aims to design android-based learning media on valid trigonometric material and improve students' mathematical critical thinking skills. This development research using the ADDIE model took 121 people consisting of expert validators, user (teacher), and students. The expert validators consisted of one mathematics education material expert and one ICT expert. Meanwhile, user represented by one mathematics teacher were involved in validating the use of the media design. In addition, there were participants from among students, which included 118 class X high school students throughout the Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school in the medium cluster. So, the reason for taking the sample represents the condition of students both on the island of Java and in Indonesia. The results showed that the developed android-based learning media was valid and could be used without revision with a combined percentage of 87.33%, with details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. The results of the practicality test on students of 81% showed that the Android-based learning media design had a strong response, so the learning media made were very practical to use. The product test results show that the achievement of mathematical critical thinking skills of students who learn to use android-based learning media is better than those who learn not to use android-based learning media.

KEYWORDS

android, critical thinking, development study, mathematics learning, trigonometry

1. Introduction

The COVID-19 pandemic has forced the world of education to make maximum use of technology in the delayed learning process. Learning in mathematics that utilizes technological advances in the form of online learning can facilitate teachers and students simultaneously in delivering and obtaining subject matter (Chai et al., 2013; Bertram, 2020; Reddy et al., 2021; Mahmud et al., 2022; Su et al., 2022). One of the uses of online learning media that is currently in great demand by various groups is the use of Android on smartphones (mobile). The development of information technology has now been used in various schools to implement interactive learning media based on Android using a PC or smartphone.

The use of Android as a learning medium gets a positive response from various groups and also provides some convenience in the online learning process. Churiyah et al. (2020) recommend that there are several conveniences in android-based online learning, including for teachers that student learning outcomes can be known directly, learning activities are not limited to distance, time, and place, in the learning process, students can be accompanied by parents, students can access the network with the internet, students can take advantage of the media in their surrounding environment and have a lot of time with family. Irfan and Wulandari (2019) stated that on Android-based learning media, students can learn more easily without being limited by time and place, nor do they need to carry books. The development of learning media at this time has utilized multimedia elements that are packaged in the form of an Android application so that it can reduce student boredom in learning. However, the obstacles that often arise are not only from student factors but also from teachers and media or teaching materials that play an important role in the mastery of understanding students' prerequisite materials (Rohaeti et al., 2019; Sulisty and Kurniawan, 2020; Tran et al., 2020; Wijaya et al., 2020; Pertiwi et al., 2021; Hidayat et al., 2022).

In addition to the benefits that are a positive impact of using Android, there are also some negative impacts that arise, including that there are still many students who do not focus on learning because they are too busy with their cellphones used for social media and also playing games (Irfan and Wulandari, 2019). In addition, there are also some groups who still have difficulty getting internet access, and there are also families who do not have mobile devices. However, the positive impacts are far greater than the negative impacts. The government has also taken measures to minimize the negative impact by providing study quota assistance and creating study groups so that students who do not yet have devices can still study by joining with friends who have mobile devices.

Android-based learning media uses cellphones as a tool to facilitate effective and efficient learning so that students may learn (Martono and Nurhayati, 2014; Novaliendry et al., 2020). This is due to the Linux-based Android operating system for mobile devices, including smartphones and tablet computers, which Google and the

Open Handset Alliance developed. Android is intended to be an operating system that offers developers an open-source platform to build applications (Hakky et al., 2018; Irfan and Wulandari, 2019; Sari and Wati, 2020). Since smartphones and tablets may be used as learning aids anytime, anywhere, and with a high level of practicality, attractiveness, efficacy, and efficiency, android-based learning media is a learning medium.

Irfan and Wulandari (2019) note that the eligibility criteria for android-based learning media are categorized into two aspects, namely content or material aspects and media aspects. Aspects of the material can be viewed in terms of suitability, quality of content and objectives, and instructional quality. The media aspect can be viewed in terms of ease of use and navigation, in terms of aesthetics or beauty, in terms of media integration, and in terms of technical quality. While the criteria for android learning media, according to Sari and Wati (2020), are carried out based on student questionnaires with several aspects as follows: (1) Practical aspects; (2) Aspects of visual appearance; (3) language aspect; and (4) Aspects of effects for learning strategies. Meanwhile, according to Hakky et al. (2018), the eligibility criteria for android-based learning media are divided into two, namely material assessment and media assessment. The assessment of a piece of content takes into some factors, including: (1) the relevance of the content; (2) the structure of the content; (3) the evaluation and practice questions; (4) the linguistic element; (5) the effects on learning techniques; and (6) the visual appeal. The media evaluation also takes into account: (1) language features; (2) effects on learning techniques; (3) factors of software engineering; and (4) aspects of aesthetic appeal. While evaluating student responses, considerations for both learning methodologies and visual appeal are taken into account.

The eligibility criteria for the Android-based learning media used are similar, then the researchers used three criteria: material criteria, media criteria, and student response questionnaires. The material assessment criteria are divided into several categories: (1) the material's relevance; (2) its organization; (3) evaluation and practice questions; (4) the language aspect; (5) the effects on learning strategies; and (6) its visual appearance. Language aspects, effects for learning strategies, software engineering aspects, and visual appearance aspects are all included in media evaluation. The following topics are covered in student response questionnaires: (1) practical aspects, (2) visual appearance aspects, (3) language aspects, and (4) effects on learning strategies.

Trigonometry is one of the mathematical topics that can help you develop more mathematical skills (Basir and Maharanib, 2018; Wijaya et al., 2020). Furthermore, trigonometrical material is used in many other fields of science, such as architecture, navigation, engineering, studying the motion of celestial bodies such as the sun, moon, and stars and their calculations, and several other branches of physics (Purwanti, 2017; Basir and Maharanib, 2018). There are so many roles for this trigonometry material that it is critical that students understand it at the high school level and even higher, namely in college, where trigonometry material appears frequently and becomes one of the requirements for graduation.

Trigonometry's importance is still not balanced with students' mathematical critical thinking skills. Higher-order thinking skills in mathematics are expected to be important learning outcomes (Lewis and Smith, 1993; Kurniati et al., 2015; Abdullah et al., 2016; Zetriuslita and Ariawan, 2021; Hendriana et al., 2022). The ability to solve non-routine problems is defined as critical thinking (Mogari and Chirove, 2017; Kurniati and Asari, 2019; Sari and Hidayat, 2019). Thus, critical thinking skills can be defined as logical thinking that is reasoned and focused on solving mathematical problems (Lewis and Smith, 1993; Widyatiningsy et al., 2015; Paul and Elder, 2019). Thus, mathematical critical thinking ability is a systematic ability that can be used to solve mathematical problems by combining prior knowledge with mathematical reasoning abilities.

However, in reality, mathematics learning activities in Indonesia have not fully trained students' critical thinking skills. This can be proven from several times the results of the Trends in International Mathematics and Science Study (TIMSS) with high-level cognitive questions that measure critical thinking skills. In the 2015 TIMSS, Indonesia was ranked 46th out of 51 countries with a score of 397 (Safari, 2021). Then in the 2018 Program for International Student Assessment (PISA) results, it shows that Indonesia's achievement in mathematics has a score of 379 which indicates a decrease of 7 points from that obtained in 2015 (Setiawan et al., 2021). This concludes that the improvement of students' mathematical critical thinking skills still needs to be improved.

Student's difficulties in learning trigonometry during the COVID-19 pandemic make it urgent to research teaching media development. In this case, the researcher studied the effect of android-based learning media on trigonometry material to improve students' mathematical critical thinking skills. This research is expected to produce a valid product about android-based learning media in trigonometry material. In addition, the resulting product can also meet practical aspects so that it can be widely applied in learning.

Aside from the above study, the authors want to see how much Android-based trigonometry learning media is expected to improve students' mathematical critical thinking skills during the COVID-19 pandemic. This study aims to analyze and investigate: (1) the process of developing android-based learning media on trigonometric material; and (2) the results of the application of android-based trigonometry learning in improving students' mathematical critical thinking skills.

2. Research methods

The ADDIE (Analysis, Design, Development, Implementation, and Evaluation) model is used in this development research to create android-based learning media on trigonometry material to improve students' mathematical critical thinking skills during the COVID-19 pandemic. Figure 1 depicts the stages of the ADDIE development model.

Participants involved in developing the implementation of this android-based learning media product amounted to 121 people, expert validators, the user (teacher), and students. The expert validators consisted of one material expert in the field of mathematics education (Dr. Sri Adi Widodo, M.Pd, lecturer at the Universitas Sarjanawiyata Tamansiswa, Yogyakarta, Indonesia) and one ICT expert (Dr. Surya Amami Pramuditya, M.Sc, Head of Media and Learning Device Development at the Universitas Swadaya Gunung Jati, Cirebon, Indonesia). Meanwhile, the user represented by one of the mathematics teachers (Agie Ginarnjar, S.Pd, Guru SMA Negeri 2 Padalarang, West Java, Indonesia) was involved in validating the use of media designs. In addition, there were participants from among students, which included 118 class X high school students throughout the Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school in the medium cluster. So, the reason for taking the sample represents the condition of students both on the island of Java and in Indonesia.

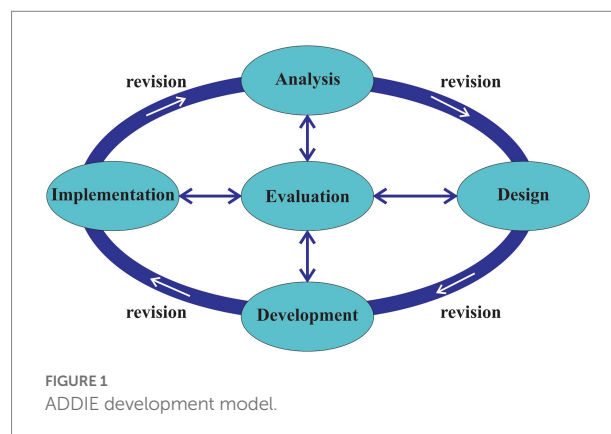

The subject matter of trigonometry that is used as the focus of this research is: (1) Trigonometric ratios and angle measures; (2) Special angle trigonometric ratio; (3) Graphs of trigonometric functions; and (4) The sine, cosine, and area rules of a triangle.

Students' mathematical critical thinking ability is measured through a test with the characteristics of a good critical thinking ability test. The following is an example of a student's mathematical critical thinking ability test (see Figure 2).

2.1. Analysis stage

The analysis is performed to determine the learning needs and competencies that students must master. Details of activities during the analysis stage, specifically:

- A user needs analysis is a study that is conducted to determine what is required in the development of learning media. The information was gathered through interviews with the goal of eliciting information about problems encountered while learning trigonometry material.

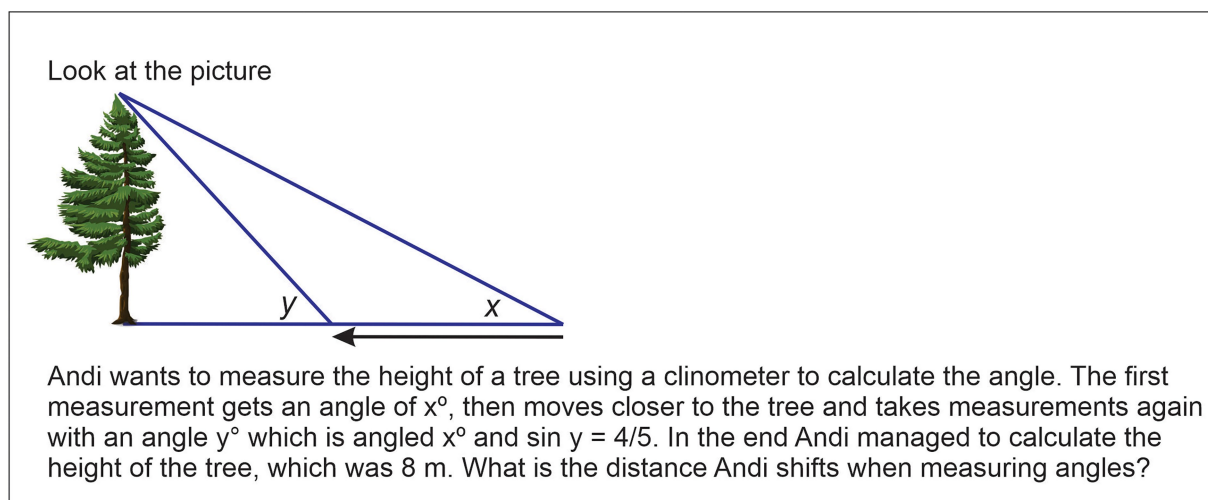

FIGURE 2

An example of a student's mathematical critical thinking ability test.

- b. Identification of needs (problems) seeks to discover the solutions that must be proposed in the design of android-based learning media in order for students to master the competencies required.

2.2. Design stage

This stage's activities are divided into five steps, which are as follows:

- a. Developing competencies, namely developing specific competencies that students must achieve in designing android-based learning media, so that students can be self-sufficient (mathematical critical thinking skills).
- b. Determine the learning material, which is trigonometry in class X SMA. This material was chosen to keep the discussion from becoming too broad.
- c. The researcher creates an android-based learning media strategy to aid the learning process and ensure that the predetermined competency goals are met. This product contains at least three media that are combined into one, namely a Google Form, a Wizer.me interactive worksheet, and an Apperception video.
- d. Evaluation, specifically evaluating the equipment and conditions required by students in order to achieve the learning competencies that are expected.
- e. Sources, specifically locating and determining learning resources that can aid in the creation of this android.

2.3. Development stage

The development stage consists of producing or creating specifications for android-based learning media that were

determined during the design stage. The android-based learning media must then be validated before being used in the learning process once it has been completed in production. Activities carried out during the development stage include:

- a. Creating learning media, specifically Android-based learning media. Android-based learning media is created with the PowerPoint application, which is easily accessible on a laptop. Furthermore, it is converted into an application using APK Builder Pro 3.4, so that it becomes a product in.html and is ready to be explored into an application that is ready to be installed. Making android-based learning media that is scientifically tailored to the needs of students learning trigonometry material.
- b. Validation of Learning Media, which includes expert, user, and audience validation in the form of a questionnaire the validation of learning media. This validation is intended to gather feedback for revising android-based learning media so that it can be said to be usable.

In this case, expert validation is performed by a single lecturer who is both a material expert and a media expert. Mathematics teachers perform user validation, and students are tested for audience validation. The validated criteria for assessment aspects include:

- a. Material expert assessment: (1) aspects of material relevance; (2) aspects of material organization; (3) aspects of evaluation and practice questions; (4) language aspects; (5) effects of learning strategies; and (6) visual appearance.
- b. Evaluation of media experts: (1) language aspects; (2) effects on learning strategies aspects; (3) software engineering aspects; and (4) visual appearance aspects.

- c. User evaluation: (1) aspects of material relevance; (2) aspects of the material organization; (3) aspects of evaluation and practice questions; (4) language aspect; (5) effects for learning strategies; and (6) visual appearance.
- d. A student response questionnaire with three sections: (1) language aspects, (2) effects for learning strategies, and (3) visual appearance aspects.

Rubric or product development validation criteria are presented in [Table 1](#).

In addition to focusing on the design and manufacture of android-based learning media, at this development stage, simulations were also carried out to support the validation stage (especially the student response questionnaire). Simulations were carried out on class X SMA students in the form of a limited trial of 20 people, an extensive trial of 50 people (from two classes in two schools), and a product test of 48 people (from two classes in one school, each with 24 students). The lesson design in this study is in the form of distributing student response questionnaires that have been given simulations using android-based media that have been created. Rubric or product development practical criteria are presented in [Table 2](#).

2.4. Implementation stage

The implementation stage is when the mathematics teacher delivers learning material in the classroom. Material is submitted using android-based learning media that has been validated by experts, as well as a control class that does not receive media as a benchmark for evaluating material for the experimental class. The number of samples at this implementation stage was 48 from two classes (24 people each).

Experimental and control class were determined randomly, and both classes had the same ability based on the average

0–20	Not Practical

achievement of the previous material. Before the product test was carried out, the two classes had yet to experience learning using android-based media.

One of the objectives of this research is to improve students' mathematical critical thinking skills using android-based learning media that has been developed. Therefore, a mathematical critical thinking ability test was conducted at the end of the lesson. The results were analyzed using a statistical test, the independent sample t-test, using JASP Statistics software.

2.5. Evaluation stage

The evaluation was carried out to determine the quality of the finished products, which were android-based learning media. This level of quality will be evident if android-based learning media can improve students' mathematical critical thinking skills both before and after learning. In this step, the researcher classified the data to improve students' mathematical critical thinking skills, which would be measured using test questions administered at the beginning and end of the lesson. If students' mathematical critical thinking skills improve, learning with android-based learning media is considered successful; however, if there is no improvement or a decrease, the developed android-based learning media must be improved. [Figure 3](#) depicts the entire flow of research and development activities.

3. Results

This development produced learning media in the form of Android applications based on Trigonometry material. The resulting application is a file with an.apk extension that is installed on an Android smartphone. PowerPoint is used as a medium for application development, which is then exported into an application using Website 2 APK Builder Pro 3.4. It also makes use of several supporting applications, such as g-form, interactive worksheets, and interactive videos, to create self-contained applications that teachers, students, and parents can easily control. The outcomes of the development stages used in the ADDIE development model (Analysis, Design, Development, Implementation, and Evaluation).

3.1. Analysis stage

The following steps are required to determine the initial needs for developing learning media: (1) User Needs Analysis, (2) Student Learning Style Analysis, and (3) Curriculum or Content Analysis. Before moving on to the user requirements analysis stage, the problem is identified and the required solution is determined. Based on observations of classroom learning, student interviews, discussions with mathematics teachers, and readings from various articles, problems were identified, including students'

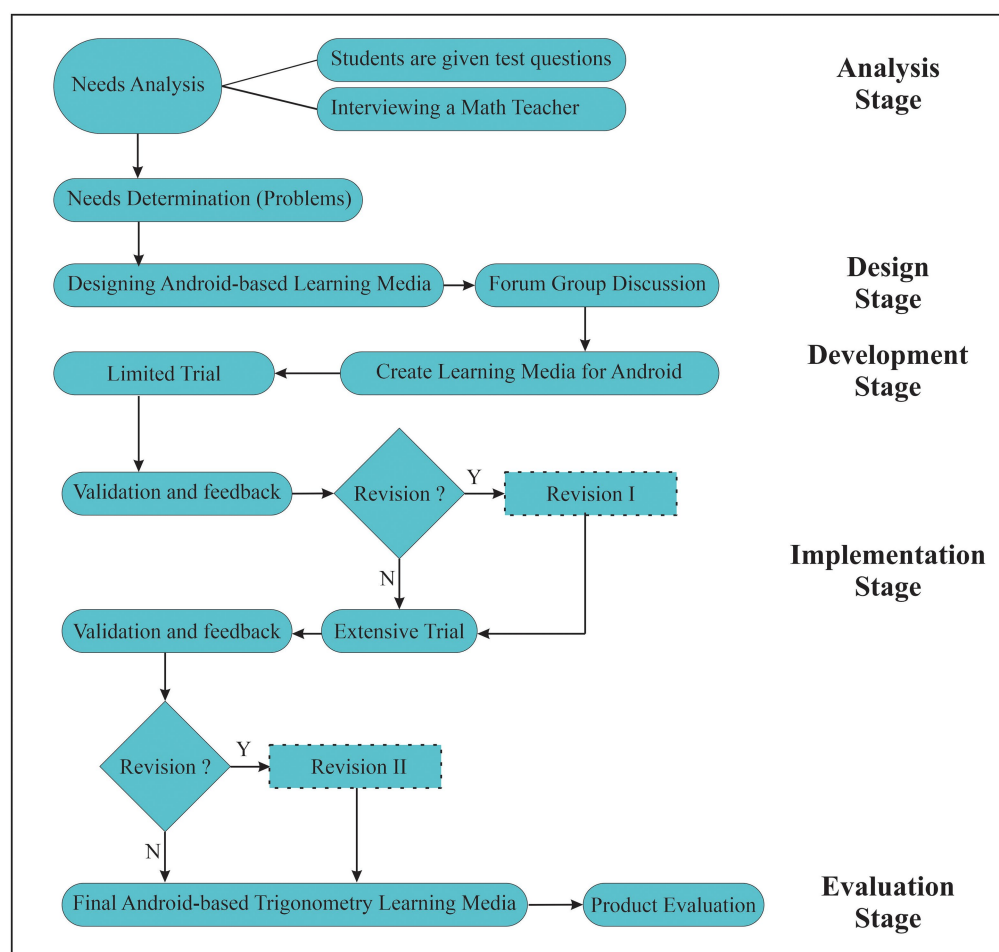

FIGURE 3

Flow of research and development activities.

basic mathematical abilities and lack of interest. This is caused by a number of things, including the lack of independent learning media, a lack of innovation and variety in the use of media, and a lack of use of Android devices as learning tools. Making learning media can be used to solve previous issues.

The need for the product is determined by analyzing user needs. Table 3 shows the data from observations and interviews used to determine needs.

The findings of the observations and interviews are then analyzed to determine user needs, which are supported by the specifications/features of learning media (see Table 4).

The analysis results related to the required features and content (see Table 2) must have the characteristics of learning media to produce a good display. This media development incorporates Alessi and Trollip's (Alessi and Trollip, 2000) media characteristics, namely: (a) introduction to learning media; (b) student control; (c) consistency; and (d) presentation mode. The start page in the form of the media title and developer identity marks the beginning. A login button is presented so that users can proceed to the next page. Student control allows users to interact with learning media. Control is accomplished through

the use of specific buttons, namely menu and navigation buttons. In learning media, menu buttons include buttons for various menu options. Navigation buttons are used to move to specific pages, such as (1) Home, which takes you to the main page of learning media, (2) Next, which takes you to the next page, and (3) Back, which takes you back to the previous page. The goal of consistency is to make learning media more convenient for users. The following components have consistency applied to them: (1) putting the home, next, and back buttons at the bottom; (2) using consistent keys for the same purpose; (3) using consistent paragraphs, font sizes, and font types in the text; and (4) using a consistent color for one-way sections. While the presentation mode depicts the presentation of content in accordance with the requirements of visual elements, namely: (1) readability of media text, where learning is developed using clear and easy-to-read text. The font used is Maiandra GD, which is a suitable size and easy to read. Furthermore, the text color is adjusted to match the background color so that the text is legible. (2) Graphic quality is used in a display that is arranged with artistic quality and attractiveness. A good color element is presented with a maximum of five color shades. (3) Video

TABLE 3 Observational and interview-based data.

Evidenced	Analysis Findings
Examined subjects	Trigonometry
The learning procedure	Describe with examples, practice, and homework
Books or other educational resources are accessible.	Some textbooks can only be used at school; however, due to limited availability, not everyone can borrow textbooks from school.
The caliber of learning media	Still limited to powerpoint slides, which are rarely used. Furthermore, the media has not changed.
Student Situation	Difficulty understanding the material and requiring the teacher to explain it repeatedly; difficulty finding reference sources; and difficulty completing assignments
Teacher limitations in the classroom	Due to the perceived difficulty of the material, the inability of students to interact face-to-face due to the pandemic, and the short study periods at school, students lack the motivation to learn.
Students' technology as a source of independent learning	Some students have computers, but many more have Android smartphones that are underutilized.
Required media	Attendance, materials, videos to clarify the material, examples, and practice questions with discussion, as well as media that can be used for learning at home, are examples of media that can attract students' interest and attention.

TABLE 4 Results of user need analysis.

Requirement	Analysis Findings

Displaying materials and examples 5. Available instructional videos (edpuzels) 6. There are practice questions and discussions (wizer.me) 7. Developers' page for applications.

quality The video in this lesson is used to visualize the material through various examples from everyday life.

The next step is to analyze student learning styles after identifying user needs. This analysis is useful in determining what type of media will be created to suit students' learning styles in order to improve students' learning motivation. Table 5 shows the results of the analysis of student learning styles.

At the curriculum analysis or content stage, namely material relevant to the specified basic competencies. According to the syllabus, basic competencies and objectives/indicators are required for developing trigonometry learning media. Angle measures and trigonometric ratios, trigonometric ratios of special angles, graphs of trigonometric functions, rules of sin, cos, and area of triangles, and functions of trigonometric equations are all organized around these fundamental competencies. At this stage, the material compiled is guided by a variety of sources, including books, modules, and other supporting materials.

Other content that will be included in the learning media, such as videos, examples, and practice questions, must be determined in advance, in addition to the material. The videos created in this application are in the form of light videos at the

TABLE 5 Analysis of student learning styles.

beginning of learning that contains illustrations and examples of the application of trigonometry material to daily activities, and several videos are also given as examples of problem-solving. Practice questions are presented in wizer.me interactive worksheets to facilitate student work and teacher correction, and can be emailed to parents.

3.2. Design stage

The design phase produces a flowchart that describes the sequence and structure of learning media, a storyboard with a

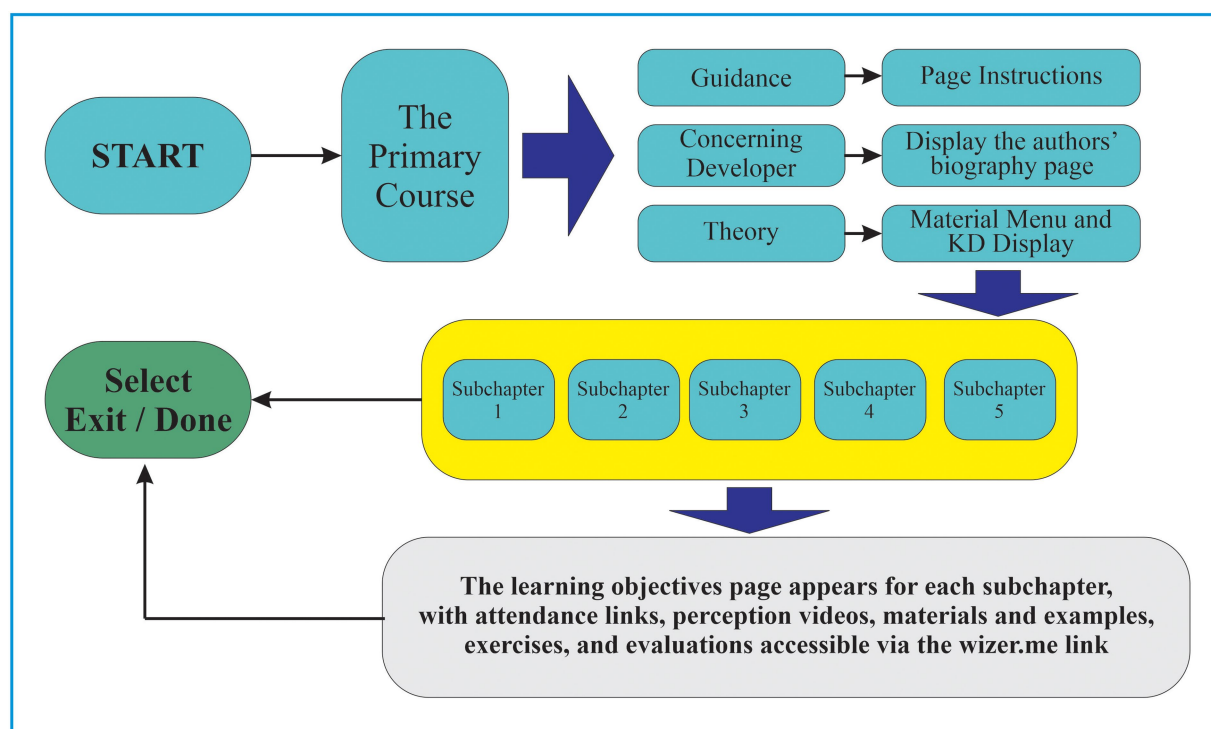

FIGURE 4
Flowchart of media structure.

template design plan, and an interface design. The created flowchart is then used as a guide for designing storyboards, resulting in a planning design that is in accordance with the media structure (see Figure 4).

The storyboard is a rough outline of the display of the learning media that will be created, including the media's content, layout, and the majority of the elements that will be included (Jones, 2008; Herbst et al., 2014; Webel and Conner, 2017). The story-board is then used as a guide in creating the interface design. The interface design creates a real storyboard representation by paying attention to the previously analyzed elements and characteristics of the learning media, such as balance, color, text, graphics, and others (see Figure 5A). The storyboard design is then translated into a real display or interface design to make it more appealing and user-friendly (see Figure 5B). Furthermore, each resource includes information on learning objectives and attendance links (see Figures 5C,D).

Exercises are also presented as a worksheet on each material page (see Figure 6). It is intended to continue to hone students' mathematical critical thinking abilities.

3.3. Development stage

Development is the stage of product development and testing in which the results of the analysis, and design are transformed into a complete finished product and validated by

experts, specifically material and media experts. In addition to validation, the developer requests feedback and suggestions from expert validators in order to improve the developed media.

3.3.1. Making educational media

This android-based learning media is created in PowerPoint, which is then converted into an html file product by APK Builder Pro 3.4 and is ready to be explored into an application that is ready to be installed.

3.3.2. Learning media validation

Experts validate learning media (material experts, media experts, and users). Dr. Sri Adi Widodo, M.Pd. is the material's validator (Lecturer of Mathematics Education, Universitas Sarjanawiyata Tamansiswa Yogyakarta, Indonesia). Users validate the development of learning media, in addition to material experts and media experts. Agie Ginanjar, S.Pd., is a mathematics teacher at SMA Negeri 2 Padalarang in West Bandung, Indonesia. Table 6 shows the results of material and user/teacher validation.

Dr. Surya Amami Pramuditya, M.Sc. is the media's, validator the media. He is the Head of Media and Learning Device Development at Indonesia's Gunung Jati Swadaya University. Table 7 summarizes the media expert validation results.

Based on the findings presented in Tables 6, 7, the overall product validation results summary is 87.33% (very valid), so the

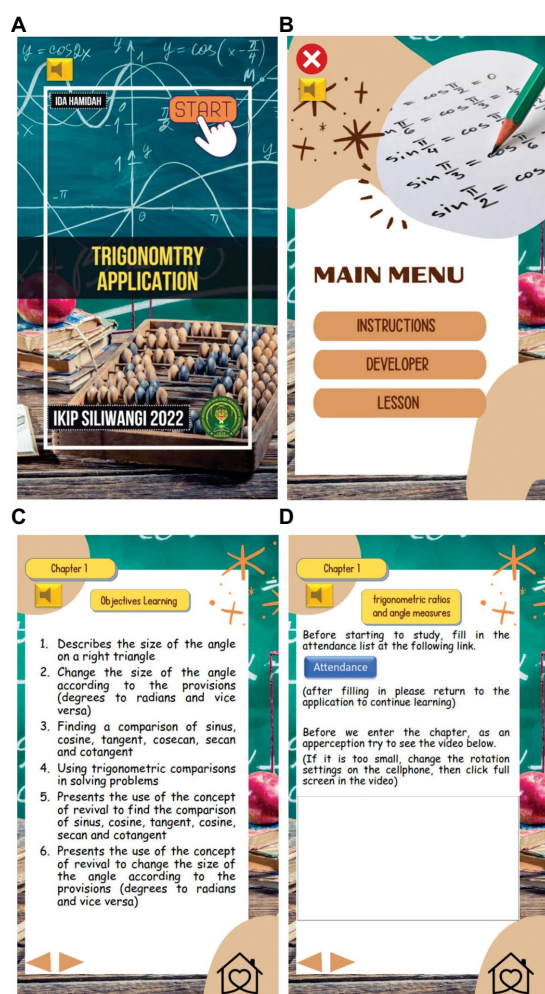

FIGURE 5
Interface design (A) homepage, (B) default menu page,
(C) learning goals, and (D) attendance links.

product design in the form of android-based learning media can be used without revision.

3.3.3. Simulation

The simulation was performed on class X high school students in the form of a limited trial of 20 people, an extensive trial of 50 people (from two classes in two schools), and a product test of 48 people (from two classes in one school, each with 24 students). The lesson design in this study takes the form of distributing student response questionnaires that have been given simulations using created android-based media. Table 8 summarizes the results of limited trials, extensive trials, and product trials.

With a response score of 81%, the analysis of student response results revealed a strong interpretation (see Table 8). This demonstrates that students feel helped in increasing mathematical critical thinking skills after receiving android-based learning media on trigonometry material. Furthermore, the developed product or media has been declared valid and can be used for learning (see Table 8).

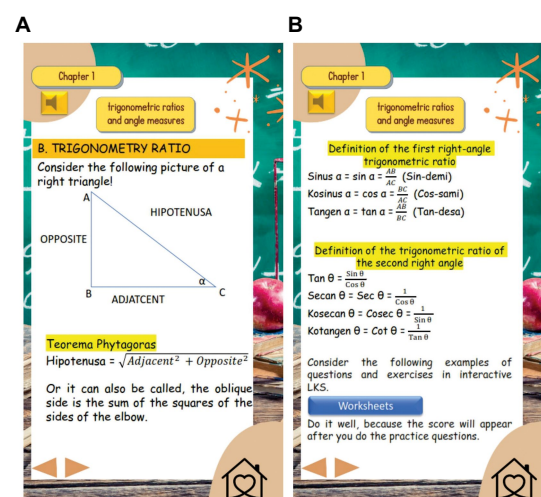

FIGURE 6
Worksheets and resource pages.

3.4. Implementation stage

Experiments were conducted on students from two classes in one school, each with 24 students. The first class is known as the experimental class, and the second is the control class. The experimental class consists of students who learn using the developed Android application media, while the control class consists of students who learn without using the developed Android application media.

Based on the assumption test analysis using JASP Statistics software, it is found that the data is normally distributed and has a homogeneous variance. This is followed by a parametric test, namely the independent sample t-test (see Table 9).

The p -value from the independent sample t-test results (see Table 9) is 0.07. As a result, those who learn using the developed android application media have better mathematical critical thinking skills than those who do not learn using the developed android application media.

3.5. Evaluation stage

The ADDIE model's final stage is evaluation. The researcher solicited responses from students who had studied with the developed Android application media during this stage of evaluation. Each action elicits a variety of reactions, both positive and negative. The most common positive response is that students' learning processes are more flexible. Students can study wherever and whenever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections.

In addition to positive responses, there are negative responses that necessitate improvements in the developed Android application media. This is because life is never static; it is constantly changing and improving with each stage. The negative response,

in the form of criticism and constructive suggestions, is that not all students have access to a cellphone with the most recent version as a device for using android application media in learning mathematics. So, in line with the research of [Hapsari and Fahmi \(2021\)](#), the researchers intend to carry out further development of this application, and the responses and suggestions obtained during the study were used as a reference for improvement.

4. Discussion

The findings of a study on the development of learning media with Android applications show that students' mathematical

critical thinking skills improve. Furthermore, the interaction between learning resources and students, learning through Android application media can increase student interest in learning ([Sari and Wati, 2020](#)). This android application begins by creating learning media with Microsoft Power-Point, which is then enhanced with I-Spring and Website 2 APK Builder. This demonstrates the advantages that students gain from the learning process, which is simple to create, free, and not overly demanding.

This android learning media also makes use of other applications in its development, such as Google Forms and Wizer. me. This is thought to make it easier for students and teachers to conduct online learning in the form of worksheets, attendance lists, and learning evaluations that parents can access. It is hoped that by using interactive worksheets, students' mathematical abilities will improve ([Pertiwi et al., 2021](#); [Kurniansyah et al., 2022](#)).

The created media summarizes trigonometry material with a scientific approach to help students improve their mathematical critical thinking skills. This media is developed in stages to produce

learning media products that are suitable for use in the learning process. Several needs analyses were performed in the first stage of the development of the developed product, which included three types of analyses: user needs analysis, student learning style analysis, and curriculum analysis (Fahmi et al., 2019; Marbán and Mulenga, 2019). This can be determined during the preliminary observations. The following analysis is to determine the theme and scope of the learning media so that the media developed is limited. The following analysis is to determine the theme and scope of the learning media so that the media developed is limited. This stage is completed by paying close attention to the material being created.

At the design stage, the goal is to sketch out the content of the android media, which is created with student characteristics in mind. Flowcharts, storyboards, and user interfaces are then created. Flowcharts are created to provide a high-level over-view of the flow or course of learning media from one slide to the next. The story-board is used to describe each slide, which includes an image display, conversation bubbles, and other pertinent information (Jones, 2008; Herbst et al., 2014; Webel and Conner, 2017). The results of this stage are displayed in the interface. This design stage went through several revisions based on the validator's direction and input before becoming a complete media design. Following the results of the tests, the media design underwent at least two improvements to produce a product ready for testing.

During the development stage, researchers create the necessary learning media elements, such as text, images, videos, and materials, into a complete media that is ready to use. After the product is completed, it is validated by experts, including material experts, media experts, and math teachers. The validation process is carried out because it can help to improve the developed media (Suarsana et al., 2018; Fahmi et al., 2019; Nurwijayanti et al., 2019). Validation is based on an evaluation of the feasibility of linguistic aspects, evaluation of effects for learning strategies, evaluation of visual aspects, evaluation of material relevance aspects, evaluation of material organization aspects, and evaluation of evaluation aspects in the form of tests (Hidayat et al., 2022; Kurniansyah et al., 2022).

The implementation stage is a full learning experiment. At this point, it is clear that students who study with android application media have better mathematical critical thinking skills than students who do not study with android application media. One of the most significant reasons is that students' learning processes are more flexible. Students can study whenever and wherever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections. This is consistent with Kurniansyah et al. (2022) belief that interesting and interactive learning media can increase students' learning motivation.

The evaluation stage results indicate that the development of this android application medium is not only recommended for trigonometry material but also materials with a connection to trigonometry, such as calculus. This is because learning mathematics is interconnected with other subjects. If students have mastered the prerequisite material's mathematical critical

thinking skills, then mastering the next material's mathematical critical thinking skills should not be too difficult (Priatna et al., 2020; Lestari et al., 2021; Setiana and Purwoko, 2021). Furthermore, due to the dynamic development of technology in mathematics learning, the material presented must be developed in Android application media. This is consistent with the fact that, to foster meaningful learning for students, the mathematical material developed on Android application media must also be linked to the real-life experiences that students have daily (Van Den Heuvel-Panhuizen, 2003; Purwasih et al., 2020).

5. Conclusion

The process of developing android-based learning media on trigonometry material has gone through ADDIE development procedures, namely (1) Analysis, (2) Design, (3) Development, (4) Implementation, and (5) Evaluation. The developed media have been valid and practical and have gone through product testing to see their effectiveness. The validation results obtained are 87.33%, with details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. Furthermore, the results of the practicality test on students of 81% indicate that the android-based learning media design has a strong response, so the learning media made are very practical to use.

The achievement of students' mathematical critical thinking skills who learn using android-based media is better than those who learn without using android-based media. The achievement of students' mathematical critical thinking skills, who received learning using android-based media and those who did not use android-based media, were both in the medium category.

Research on developing android-based learning media still needs to be improved in trigonometry material and mathematical critical thinking skills. For further study, it is expected to be able to examine further the difficulties faced by students in improving other higher-order thinking skills.

Using ICT-based interactive learning media is a learning method that strongly supports the teaching and learning process for students and teachers during the COVID-19 pandemic. This ICT-based learning media must be easily accessible to teachers and students, and one of the interactive media that is easily accessible is android-based learning media. This development research aims to design android-based learning media on valid trigonometric material and improve students' mathematical critical thinking skills. This development research using the ADDIE model took 121 people consisting of expert validators, user (teacher), and students. The expert validators consisted of one mathematics education material expert and one ICT expert. Meanwhile, user represented by one mathematics teacher were involved in validating the use of the media design. In addition, there were participants from among students, which included 118 class X high school students throughout the Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school in the medium cluster. So, the reason for taking the sample represents the condition of students both on the island of Java and in Indonesia. The results showed that the developed android-based learning media was valid and could be used without revision with a combined percentage of 87.33%, with details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. The results of the practicality test on students of 81% showed that the Android-based learning media design had a strong response, so the learning media made were very practical to use. The product test results show that the achievement of mathematical critical thinking skills of students who learn to use android-based learning media is better than those who learn not to use android-based learning media.

KEYWORDS

android, critical thinking, development study, mathematics learning, trigonometry

1. Introduction

The COVID-19 pandemic has forced the world of education to make maximum use of technology in the delayed learning process. Learning in mathematics that utilizes technological advances in the form of online learning can facilitate teachers and students simultaneously in delivering and obtaining subject matter (Chai et al., 2013; Bertram, 2020; Reddy et al., 2021; Mahmud et al., 2022; Su et al., 2022). One of the uses of online learning media that is currently in great demand by various groups is the use of Android on smartphones (mobile). The development of information technology has now been used in various schools to implement interactive learning media based on Android using a PC or smartphone.

The use of Android as a learning medium gets a positive response from various groups and also provides some convenience in the online learning process. Churiyah et al. (2020) recommend that there are several conveniences in android-based online learning, including for teachers that student learning outcomes can be known directly, learning activities are not limited to distance, time, and place, in the learning process, students can be accompanied by parents, students can access the network with the internet, students can take advantage of the media in their surrounding environment and have a lot of time with family. Irfan and Wulandari (2019) stated that on Android-based learning media, students can learn more easily without being limited by time and place, nor do they need to carry books. The development of learning media at this time has utilized multimedia elements that are packaged in the form of an Android application so that it can reduce student boredom in learning. However, the obstacles that often arise are not only from student factors but also from teachers and media or teaching materials that play an important role in the mastery of understanding students' prerequisite materials (Rohaeti et al., 2019; Sulisty and Kurniawan, 2020; Tran et al., 2020; Wijaya et al., 2020; Pertiwi et al., 2021; Hidayat et al., 2022).

In addition to the benefits that are a positive impact of using Android, there are also some negative impacts that arise, including that there are still many students who do not focus on learning because they are too busy with their cellphones used for social media and also playing games (Irfan and Wulandari, 2019). In addition, there are also some groups who still have difficulty getting internet access, and there are also families who do not have mobile devices. However, the positive impacts are far greater than the negative impacts. The government has also taken measures to minimize the negative impact by providing study quota assistance and creating study groups so that students who do not yet have devices can still study by joining with friends who have mobile devices.

Android-based learning media uses cellphones as a tool to facilitate effective and efficient learning so that students may learn (Martono and Nurhayati, 2014; Novaliendry et al., 2020). This is due to the Linux-based Android operating system for mobile devices, including smartphones and tablet computers, which Google and the

Open Handset Alliance developed. Android is intended to be an operating system that offers developers an open-source platform to build applications (Hakky et al., 2018; Irfan and Wulandari, 2019; Sari and Wati, 2020). Since smartphones and tablets may be used as learning aids anytime, anywhere, and with a high level of practicality, attractiveness, efficacy, and efficiency, android-based learning media is a learning medium.

Irfan and Wulandari (2019) note that the eligibility criteria for android-based learning media are categorized into two aspects, namely content or material aspects and media aspects. Aspects of the material can be viewed in terms of suitability, quality of content and objectives, and instructional quality. The media aspect can be viewed in terms of ease of use and navigation, in terms of aesthetics or beauty, in terms of media integration, and in terms of technical quality. While the criteria for android learning media, according to Sari and Wati (2020), are carried out based on student questionnaires with several aspects as follows: (1) Practical aspects; (2) Aspects of visual appearance; (3) language aspect; and (4) Aspects of effects for learning strategies. Meanwhile, according to Hakky et al. (2018), the eligibility criteria for android-based learning media are divided into two, namely material assessment and media assessment. The assessment of a piece of content takes into some factors, including: (1) the relevance of the content; (2) the structure of the content; (3) the evaluation and practice questions; (4) the linguistic element; (5) the effects on learning techniques; and (6) the visual appeal. The media evaluation also takes into account: (1) language features; (2) effects on learning techniques; (3) factors of software engineering; and (4) aspects of aesthetic appeal. While evaluating student responses, considerations for both learning methodologies and visual appeal are taken into account.

The eligibility criteria for the Android-based learning media used are similar, then the researchers used three criteria: material criteria, media criteria, and student response questionnaires. The material assessment criteria are divided into several categories: (1) the material's relevance; (2) its organization; (3) evaluation and practice questions; (4) the language aspect; (5) the effects on learning strategies; and (6) its visual appearance. Language aspects, effects for learning strategies, software engineering aspects, and visual appearance aspects are all included in media evaluation. The following topics are covered in student response questionnaires: (1) practical aspects, (2) visual appearance aspects, (3) language aspects, and (4) effects on learning strategies.

Trigonometry is one of the mathematical topics that can help you develop more mathematical skills (Basir and Maharanib, 2018; Wijaya et al., 2020). Furthermore, trigonometrical material is used in many other fields of science, such as architecture, navigation, engineering, studying the motion of celestial bodies such as the sun, moon, and stars and their calculations, and several other branches of physics (Purwanti, 2017; Basir and Maharanib, 2018). There are so many roles for this trigonometry material that it is critical that students understand it at the high school level and even higher, namely in college, where trigonometry material appears frequently and becomes one of the requirements for graduation.

Trigonometry's importance is still not balanced with students' mathematical critical thinking skills. Higher-order thinking skills in mathematics are expected to be important learning outcomes (Lewis and Smith, 1993; Kurniati et al., 2015; Abdullah et al., 2016; Zetriuslita and Ariawan, 2021; Hendriana et al., 2022). The ability to solve non-routine problems is defined as critical thinking (Mogari and Chirove, 2017; Kurniati and Asari, 2019; Sari and Hidayat, 2019). Thus, critical thinking skills can be defined as logical thinking that is reasoned and focused on solving mathematical problems (Lewis and Smith, 1993; Widyatiningsy et al., 2015; Paul and Elder, 2019). Thus, mathematical critical thinking ability is a systematic ability that can be used to solve mathematical problems by combining prior knowledge with mathematical reasoning abilities.

However, in reality, mathematics learning activities in Indonesia have not fully trained students' critical thinking skills. This can be proven from several times the results of the Trends in International Mathematics and Science Study (TIMSS) with high-level cognitive questions that measure critical thinking skills. In the 2015 TIMSS, Indonesia was ranked 46th out of 51 countries with a score of 397 (Safari, 2021). Then in the 2018 Program for International Student Assessment (PISA) results, it shows that Indonesia's achievement in mathematics has a score of 379 which indicates a decrease of 7 points from that obtained in 2015 (Setiawan et al., 2021). This concludes that the improvement of students' mathematical critical thinking skills still needs to be improved.

Student's difficulties in learning trigonometry during the COVID-19 pandemic make it urgent to research teaching media development. In this case, the researcher studied the effect of android-based learning media on trigonometry material to improve students' mathematical critical thinking skills. This research is expected to produce a valid product about android-based learning media in trigonometry material. In addition, the resulting product can also meet practical aspects so that it can be widely applied in learning.

Aside from the above study, the authors want to see how much Android-based trigonometry learning media is expected to improve students' mathematical critical thinking skills during the COVID-19 pandemic. This study aims to analyze and investigate: (1) the process of developing android-based learning media on trigonometric material; and (2) the results of the application of android-based trigonometry learning in improving students' mathematical critical thinking skills.

2. Research methods

The ADDIE (Analysis, Design, Development, Implementation, and Evaluation) model is used in this development research to create android-based learning media on trigonometry material to improve students' mathematical critical thinking skills during the COVID-19 pandemic. Figure 1 depicts the stages of the ADDIE development model.

Participants involved in developing the implementation of this android-based learning media product amounted to 121 people, expert validators, the user (teacher), and students. The expert validators consisted of one material expert in the field of mathematics education (Dr. Sri Adi Widodo, M.Pd, lecturer at the Universitas Sarjanawiyata Tamansiswa, Yogyakarta, Indonesia) and one ICT expert (Dr. Surya Amami Pramuditya, M.Sc, Head of Media and Learning Device Development at the Universitas Swadaya Gunung Jati, Cirebon, Indonesia). Meanwhile, the user represented by one of the mathematics teachers (Agie Ginarnjar, S.Pd, Guru SMA Negeri 2 Padalarang, West Java, Indonesia) was involved in validating the use of media designs. In addition, there were participants from among students, which included 118 class X high school students throughout the Province of West Java, Indonesia, who took part in a limited trial phase of 20 people, an extensive trial of 50 people, and a product trial of 48 people. A sample of 118 students came from high school in the medium cluster. So, the reason for taking the sample represents the condition of students both on the island of Java and in Indonesia.

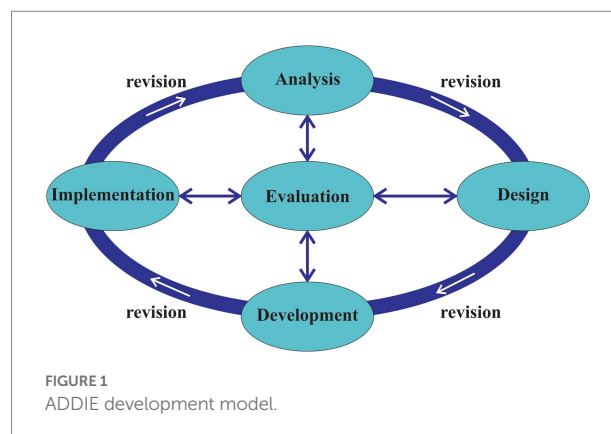

The subject matter of trigonometry that is used as the focus of this research is: (1) Trigonometric ratios and angle measures; (2) Special angle trigonometric ratio; (3) Graphs of trigonometric functions; and (4) The sine, cosine, and area rules of a triangle.

Students' mathematical critical thinking ability is measured through a test with the characteristics of a good critical thinking ability test. The following is an example of a student's mathematical critical thinking ability test (see Figure 2).

2.1. Analysis stage

The analysis is performed to determine the learning needs and competencies that students must master. Details of activities during the analysis stage, specifically:

- a. A user needs analysis is a study that is conducted to determine what is required in the development of learning media. The information was gathered through interviews with the goal of eliciting information about problems encountered while learning trigonometry material.

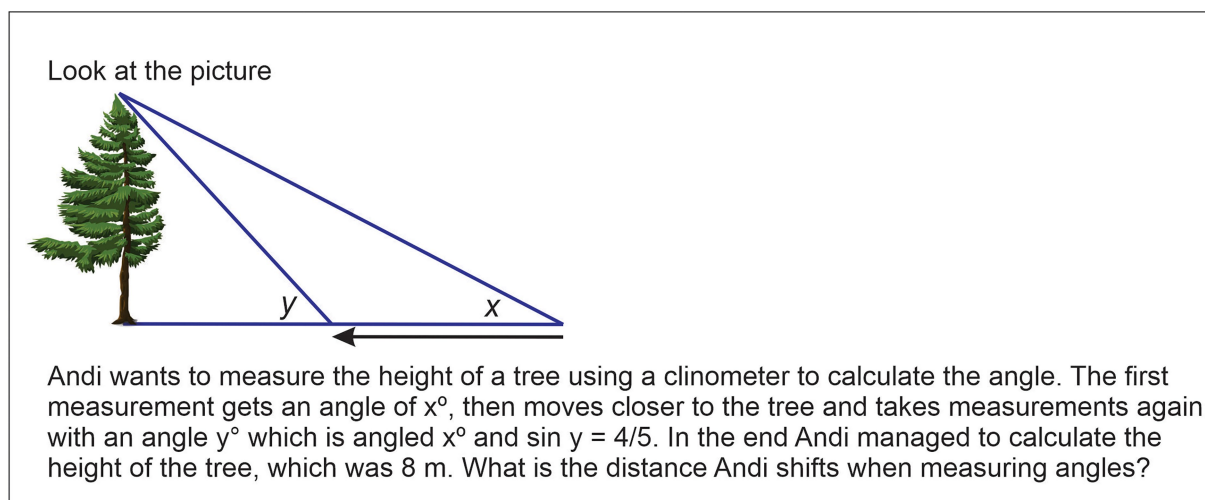

FIGURE 2
An example of a student's mathematical critical thinking ability test.

- b. Identification of needs (problems) seeks to discover the solutions that must be proposed in the design of android-based learning media in order for students to master the competencies required.

2.2. Design stage

This stage's activities are divided into five steps, which are as follows:

- a. Developing competencies, namely developing specific competencies that students must achieve in designing android-based learning media, so that students can be self-sufficient (mathematical critical thinking skills).
- b. Determine the learning material, which is trigonometry in class X SMA. This material was chosen to keep the discussion from becoming too broad.
- c. The researcher creates an android-based learning media strategy to aid the learning process and ensure that the predetermined competency goals are met. This product contains at least three media that are combined into one, namely a Google Form, a Wizer.me interactive worksheet, and an Apperception video.
- d. Evaluation, specifically evaluating the equipment and conditions required by students in order to achieve the learning competencies that are expected.
- e. Sources, specifically locating and determining learning resources that can aid in the creation of this android.

2.3. Development stage

The development stage consists of producing or creating specifications for android-based learning media that were

determined during the design stage. The android-based learning media must then be validated before being used in the learning process once it has been completed in production. Activities carried out during the development stage include:

- a. Creating learning media, specifically Android-based learning media. Android-based learning media is created with the PowerPoint application, which is easily accessible on a laptop. Furthermore, it is converted into an application using APK Builder Pro 3.4, so that it becomes a product in.html and is ready to be explored into an application that is ready to be installed. Making android-based learning media that is scientifically tailored to the needs of students learning trigonometry material.
- b. Validation of Learning Media, which includes expert, user, and audience validation in the form of a questionnaire the validation of learning media. This validation is intended to gather feedback for revising android-based learning media so that it can be said to be usable.

In this case, expert validation is performed by a single lecturer who is both a material expert and a media expert. Mathematics teachers perform user validation, and students are tested for audience validation. The validated criteria for assessment aspects include:

- a. Material expert assessment: (1) aspects of material relevance; (2) aspects of material organization; (3) aspects of evaluation and practice questions; (4) language aspects; (5) effects of learning strategies; and (6) visual appearance.
- b. Evaluation of media experts: (1) language aspects; (2) effects on learning strategies aspects; (3) software engineering aspects; and (4) visual appearance aspects.

- c. User evaluation: (1) aspects of material relevance; (2) aspects of the material organization; (3) aspects of evaluation and practice questions; (4) language aspect; (5) effects for learning strategies; and (6) visual appearance.
- d. A student response questionnaire with three sections: (1) language aspects, (2) effects for learning strategies, and (3) visual appearance aspects.

Rubric or product development validation criteria are presented in [Table 1](#).

In addition to focusing on the design and manufacture of android-based learning media, at this development stage, simulations were also carried out to support the validation stage (especially the student response questionnaire). Simulations were carried out on class X SMA students in the form of a limited trial of 20 people, an extensive trial of 50 people (from two classes in two schools), and a product test of 48 people (from two classes in one school, each with 24 students). The lesson design in this study is in the form of distributing student response questionnaires that have been given simulations using android-based media that have been created. Rubric or product development practical criteria are presented in [Table 2](#).

2.4. Implementation stage

The implementation stage is when the mathematics teacher delivers learning material in the classroom. Material is submitted using android-based learning media that has been validated by experts, as well as a control class that does not receive media as a benchmark for evaluating material for the experimental class. The number of samples at this implementation stage was 48 from two classes (24 people each).

Experimental and control class were determined randomly, and both classes had the same ability based on the average

achievement of the previous material. Before the product test was carried out, the two classes had yet to experience learning using android-based media.

One of the objectives of this research is to improve students' mathematical critical thinking skills using android-based learning media that has been developed. Therefore, a mathematical critical thinking ability test was conducted at the end of the lesson. The results were analyzed using a statistical test, the independent sample t-test, using JASP Statistics software.

2.5. Evaluation stage

The evaluation was carried out to determine the quality of the finished products, which were android-based learning media. This level of quality will be evident if android-based learning media can improve students' mathematical critical thinking skills both before and after learning. In this step, the researcher classified the data to improve students' mathematical critical thinking skills, which would be measured using test questions administered at the beginning and end of the lesson. If students' mathematical critical thinking skills improve, learning with android-based learning media is considered successful; however, if there is no improvement or a decrease, the developed android-based learning media must be improved. [Figure 3](#) depicts the entire flow of research and development activities.

3. Results

This development produced learning media in the form of Android applications based on Trigonometry material. The resulting application is a file with an.apk extension that is installed on an Android smartphone. PowerPoint is used as a medium for application development, which is then exported into an application using Website 2 APK Builder Pro 3.4. It also makes use of several supporting applications, such as g-form, interactive worksheets, and interactive videos, to create self-contained applications that teachers, students, and parents can easily control. The outcomes of the development stages used in the ADDIE development model (Analysis, Design, Development, Implementation, and Evaluation).

3.1. Analysis stage

The following steps are required to determine the initial needs for developing learning media: (1) User Needs Analysis, (2) Student Learning Style Analysis, and (3) Curriculum or Content Analysis. Before moving on to the user requirements analysis stage, the problem is identified and the required solution is determined. Based on observations of classroom learning, student interviews, discussions with mathematics teachers, and readings from various articles, problems were identified, including students'

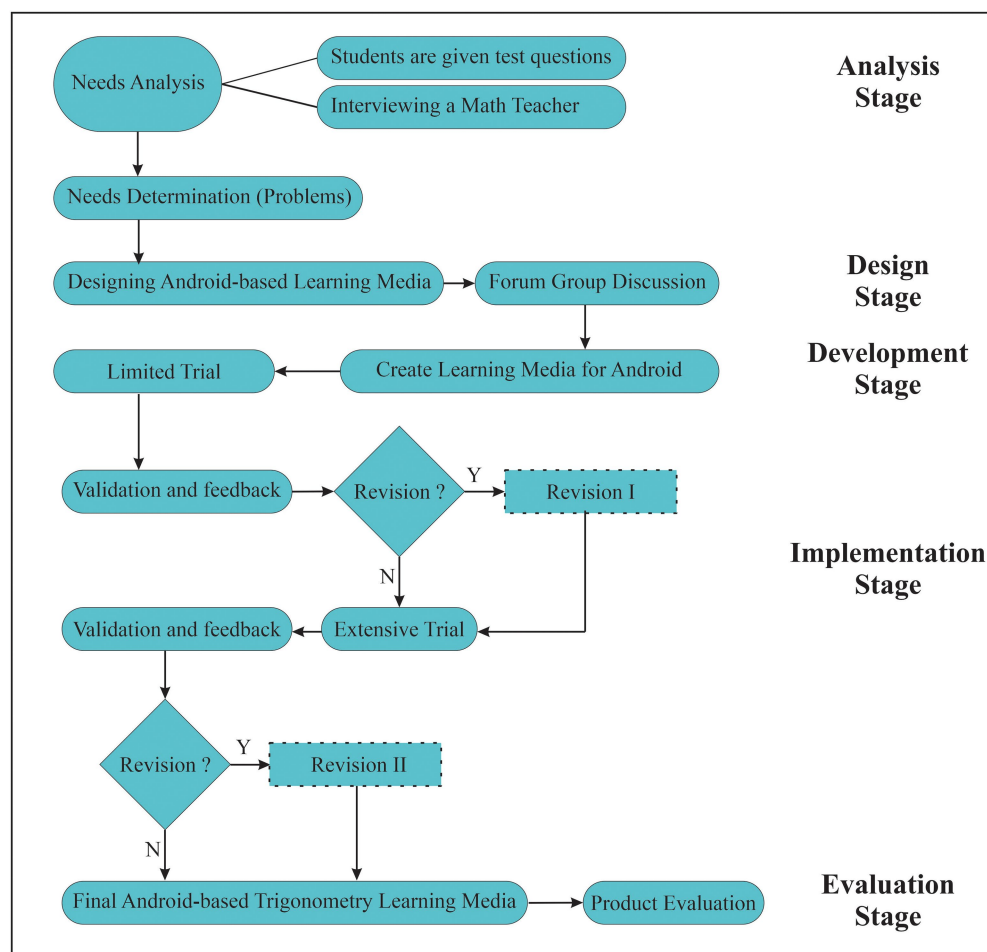

FIGURE 3
Flow of research and development activities.

basic mathematical abilities and lack of interest. This is caused by a number of things, including the lack of independent learning media, a lack of innovation and variety in the use of media, and a lack of use of Android devices as learning tools. Making learning media can be used to solve previous issues.

The need for the product is determined by analyzing user needs. Table 3 shows the data from observations and interviews used to determine needs.

The findings of the observations and interviews are then analyzed to determine user needs, which are supported by the specifications/features of learning media (see Table 4).

The analysis results related to the required features and content (see Table 2) must have the characteristics of learning media to produce a good display. This media development incorporates Alessi and Trollip's (Alessi and Trollip, 2000) media characteristics, namely: (a) introduction to learning media; (b) student control; (c) consistency; and (d) presentation mode. The start page in the form of the media title and developer identity marks the beginning. A login button is presented so that users can proceed to the next page. Student control allows users to interact with learning media. Control is accomplished through

the use of specific buttons, namely menu and navigation buttons. In learning media, menu buttons include buttons for various menu options. Navigation buttons are used to move to specific pages, such as (1) Home, which takes you to the main page of learning media, (2) Next, which takes you to the next page, and (3) Back, which takes you back to the previous page. The goal of consistency is to make learning media more convenient for users. The following components have consistency applied to them: (1) putting the home, next, and back buttons at the bottom; (2) using consistent keys for the same purpose; (3) using consistent paragraphs, font sizes, and font types in the text; and (4) using a consistent color for one-way sections. While the presentation mode depicts the presentation of content in accordance with the requirements of visual elements, namely: (1) readability of media text, where learning is developed using clear and easy-to-read text. The font used is Maiandra GD, which is a suitable size and easy to read. Furthermore, the text color is adjusted to match the background color so that the text is legible. (2) Graphic quality is used in a display that is arranged with artistic quality and attractiveness. A good color element is presented with a maximum of five color shades. (3) Video

TABLE 3 Observational and interview-based data.

Evidenced	Analysis Findings
Examined subjects	Trigonometry
The learning procedure	Describe with examples, practice, and homework
Books or other educational resources are accessible.	Some textbooks can only be used at school; however, due to limited availability, not everyone can borrow textbooks from school.
The caliber of learning media	Still limited to powerpoint slides, which are rarely used. Furthermore, the media has not changed.
Student Situation	Difficulty understanding the material and requiring the teacher to explain it repeatedly; difficulty finding reference sources; and difficulty completing assignments
Teacher limitations in the classroom	Due to the perceived difficulty of the material, the inability of students to interact face-to-face due to the pandemic, and the short study periods at school, students lack the motivation to learn.
Students' technology as a source of independent learning	Some students have computers, but many more have Android smartphones that are underutilized.
Required media	Attendance, materials, videos to clarify the material, examples, and practice questions with discussion, as well as media that can be used for learning at home, are examples of media that can attract students' interest and attention.

TABLE 4 Results of user need analysis.

Requirement	Analysis Findings
User Aims	SMA/MA/SMK students in Class X
Learning Media Categories	Trigonometry learning media takes the form of an app that can be downloaded and installed on an Android smartphone for independent study.
Features that are required	1. Instructions for use 2. Contains fundamental competencies and learning objectives 3. There is an email-synchronized attendance list link (g-from) 4. Displaying materials and examples 5. Available instructional videos (edpuzels) 6. There are practice questions and discussions (wizer.me) 7. Developers' page for applications.

quality The video in this lesson is used to visualize the material through various examples from everyday life.

The next step is to analyze student learning styles after identifying user needs. This analysis is useful in determining what type of media will be created to suit students' learning styles in order to improve students' learning motivation. Table 5 shows the results of the analysis of student learning styles.

At the curriculum analysis or content stage, namely material relevant to the specified basic competencies. According to the syllabus, basic competencies and objectives/indicators are required for developing trigonometry learning media. Angle measures and trigonometric ratios, trigonometric ratios of special angles, graphs of trigonometric functions, rules of sin, cos, and area of triangles, and functions of trigonometric equations are all organized around these fundamental competencies. At this stage, the material compiled is guided by a variety of sources, including books, modules, and other supporting materials.

Other content that will be included in the learning media, such as videos, examples, and practice questions, must be determined in advance, in addition to the material. The videos created in this application are in the form of light videos at the

TABLE 5 Analysis of student learning styles.

Analysis Findings
Students prefer to learn in a relaxed and enjoyable environment, free of stress, with opportunities for observation, practice, and discussion.
To discover the benefits of everyday learning, it is necessary to alternate between calculations and practice.
Use of educational games to assess practice questions

beginning of learning that contains illustrations and examples of the application of trigonometry material to daily activities, and several videos are also given as examples of problem-solving. Practice questions are presented in wizer.me interactive worksheets to facilitate student work and teacher correction, and can be emailed to parents.

3.2. Design stage

The design phase produces a flowchart that describes the sequence and structure of learning media, a storyboard with a

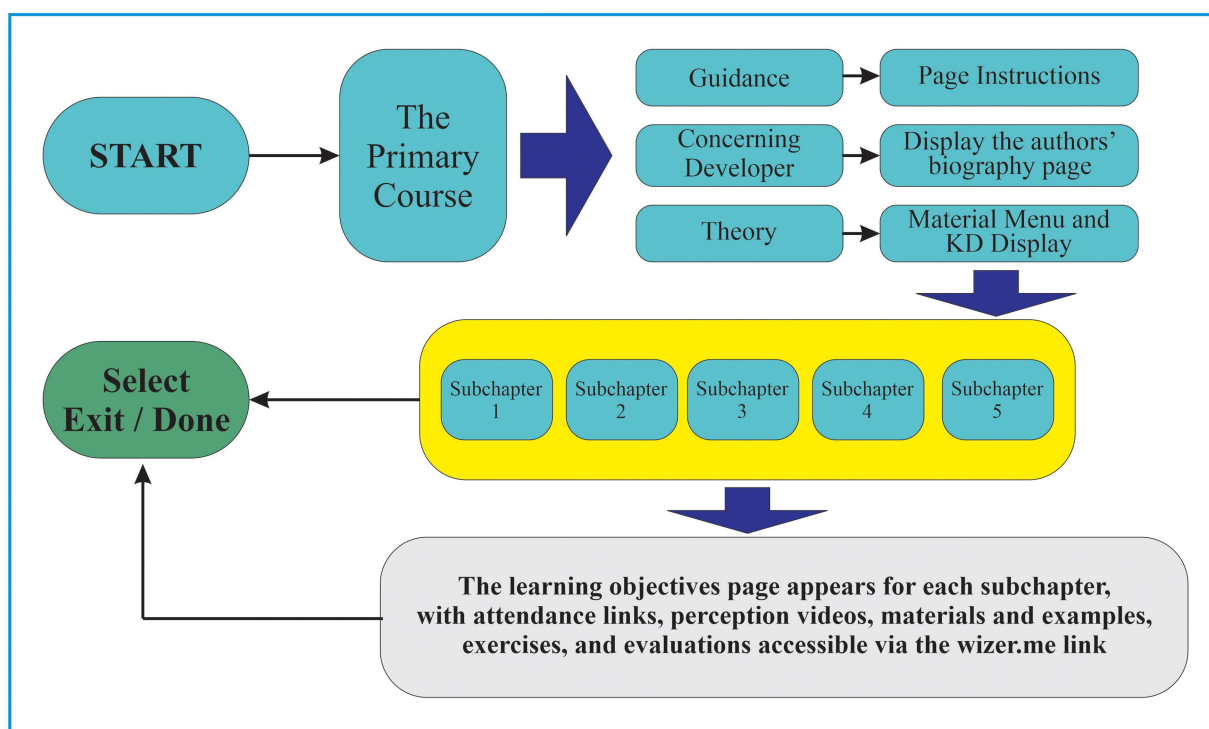

FIGURE 4
Flowchart of media structure.

template design plan, and an interface design. The created flowchart is then used as a guide for designing storyboards, resulting in a planning design that is in accordance with the media structure (see Figure 4).

The storyboard is a rough outline of the display of the learning media that will be created, including the media's content, layout, and the majority of the elements that will be included (Jones, 2008; Herbst et al., 2014; Webel and Conner, 2017). The story-board is then used as a guide in creating the interface design. The interface design creates a real storyboard representation by paying attention to the previously analyzed elements and characteristics of the learning media, such as balance, color, text, graphics, and others (see Figure 5A). The storyboard design is then translated into a real display or interface design to make it more appealing and user-friendly (see Figure 5B). Furthermore, each resource includes information on learning objectives and attendance links (see Figures 5C,D).

Exercises are also presented as a worksheet on each material page (see Figure 6). It is intended to continue to hone students' mathematical critical thinking abilities.

3.3. Development stage

Development is the stage of product development and testing in which the results of the analysis, and design are transformed into a complete finished product and validated by

experts, specifically material and media experts. In addition to validation, the developer requests feedback and suggestions from expert validators in order to improve the developed media.

3.3.1. Making educational media

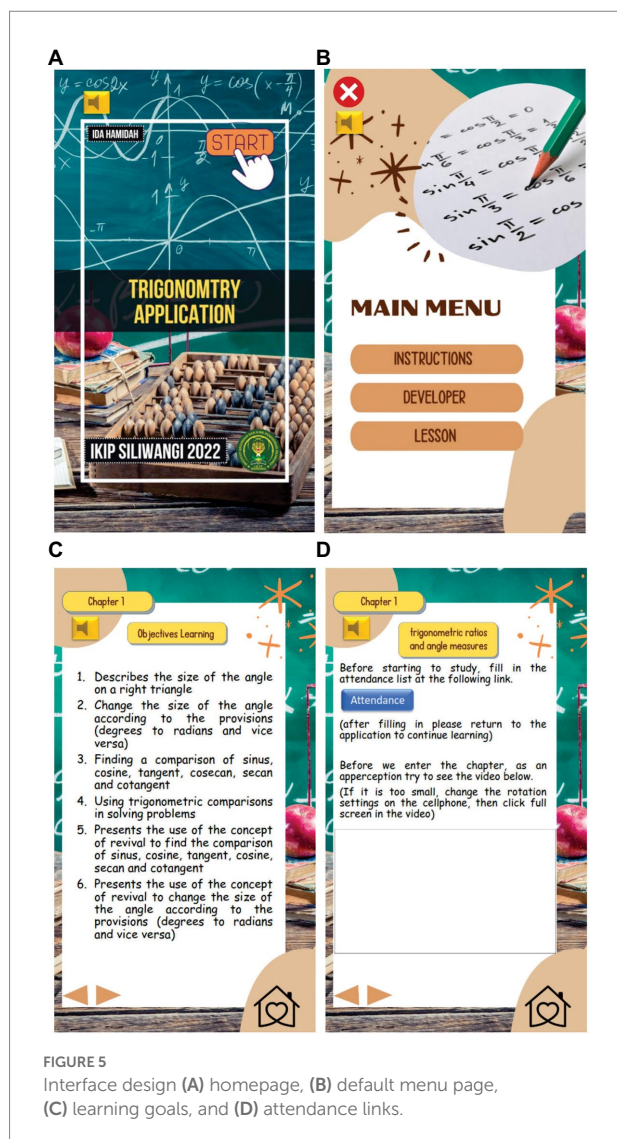

This android-based learning media is created in PowerPoint, which is then converted into an html file product by APK Builder Pro 3.4 and is ready to be explored into an application that is ready to be installed.

3.3.2. Learning media validation

Experts validate learning media (material experts, media experts, and users). Dr. Sri Adi Widodo, M.Pd. is the material's validator (Lecturer of Mathematics Education, Universitas Sarjanawiyata Tamansiswa Yogyakarta, Indonesia). Users validate the development of learning media, in addition to material experts and media experts. Agie Ginanjar, S.Pd., is a mathematics teacher at SMA Negeri 2 Padalarang in West Bandung, Indonesia. Table 6 shows the results of material and user/teacher validation.

Dr. Surya Amami Pramuditya, M.Sc. is the media's, validator the media. He is the Head of Media and Learning Device Development at Indonesia's Gunung Jati Swadaya University. Table 7 summarizes the media expert validation results.

Based on the findings presented in Tables 6, 7, the overall product validation results summary is 87.33% (very valid), so the

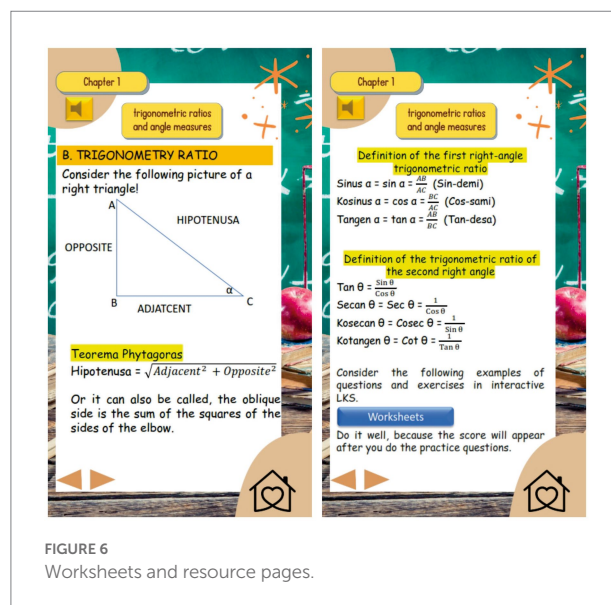

product design in the form of android-based learning media can be used without revision.

3.3.3. Simulation

The simulation was performed on class X high school students in the form of a limited trial of 20 people, an extensive trial of 50 people (from two classes in two schools), and a product test of 48 people (from two classes in one school, each with 24 students). The lesson design in this study takes the form of distributing student response questionnaires that have been given simulations using created android-based media. Table 8 summarizes the results of limited trials, extensive trials, and product trials.

With a response score of 81%, the analysis of student response results revealed a strong interpretation (see Table 8). This demonstrates that students feel helped in increasing mathematical critical thinking skills after receiving android-based learning media on trigonometry material. Furthermore, the developed product or media has been declared valid and can be used for learning (see Table 8).

3.4. Implementation stage

Experiments were conducted on students from two classes in one school, each with 24 students. The first class is known as the experimental class, and the second is the control class. The experimental class consists of students who learn using the developed Android application media, while the control class consists of students who learn without using the developed Android application media.

Based on the assumption test analysis using JASP Statistics software, it is found that the data is normally distributed and has a homogeneous variance. This is followed by a parametric test, namely the independent sample t-test (see Table 9).

The p -value from the independent sample t-test results (see Table 9) is 0.007. As a result, those who learn using the developed android application media have better mathematical critical thinking skills than those who do not learn using the developed android application media.

3.5. Evaluation stage

The ADDIE model's final stage is evaluation. The researcher solicited responses from students who had studied with the developed Android application media during this stage of evaluation. Each action elicits a variety of reactions, both positive and negative. The most common positive response is that students' learning processes are more flexible. Students can study wherever and whenever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections.

In addition to positive responses, there are negative responses that necessitate improvements in the developed Android application media. This is because life is never static; it is constantly changing and improving with each stage. The negative response,

in the form of criticism and constructive suggestions, is that not all students have access to a cellphone with the most recent version as a device for using android application media in learning mathematics. So, in line with the research of [Hapsari and Fahmi \(2021\)](#), the researchers intend to carry out further development of this application, and the responses and suggestions obtained during the study were used as a reference for improvement.

4. Discussion

The findings of a study on the development of learning media with Android applications show that students' mathematical

critical thinking skills improve. Furthermore, the interaction between learning resources and students, learning through Android application media can increase student interest in learning ([Sari and Wati, 2020](#)). This android application begins by creating learning media with Microsoft Power-Point, which is then enhanced with I-Spring and Website 2 APK Builder. This demonstrates the advantages that students gain from the learning process, which is simple to create, free, and not overly demanding.

This android learning media also makes use of other applications in its development, such as Google Forms and Wizer. me. This is thought to make it easier for students and teachers to conduct online learning in the form of worksheets, attendance lists, and learning evaluations that parents can access. It is hoped that by using interactive worksheets, students' mathematical abilities will improve ([Pertiwi et al., 2021](#); [Kurniansyah et al., 2022](#)).

The created media summarizes trigonometry material with a scientific approach to help students improve their mathematical critical thinking skills. This media is developed in stages to produce

learning media products that are suitable for use in the learning process. Several needs analyses were performed in the first stage of the development of the developed product, which included three types of analyses: user needs analysis, student learning style analysis, and curriculum analysis (Fahmi et al., 2019; Marbán and Mulenga, 2019). This can be determined during the preliminary observations. The following analysis is to determine the theme and scope of the learning media so that the media developed is limited. The following analysis is to determine the theme and scope of the learning media so that the media developed is limited. This stage is completed by paying close attention to the material being created.

At the design stage, the goal is to sketch out the content of the android media, which is created with student characteristics in mind. Flowcharts, storyboards, and user interfaces are then created. Flowcharts are created to provide a high-level over-view of the flow or course of learning media from one slide to the next. The story-board is used to describe each slide, which includes an image display, conversation bubbles, and other pertinent information (Jones, 2008; Herbst et al., 2014; Webel and Conner, 2017). The results of this stage are displayed in the interface. This design stage went through several revisions based on the validator's direction and input before becoming a complete media design. Following the results of the tests, the media design underwent at least two improvements to produce a product ready for testing.

During the development stage, researchers create the necessary learning media elements, such as text, images, videos, and materials, into a complete media that is ready to use. After the product is completed, it is validated by experts, including material experts, media experts, and math teachers. The validation process is carried out because it can help to improve the developed media (Suarsana et al., 2018; Fahmi et al., 2019; Nurwijayanti et al., 2019). Validation is based on an evaluation of the feasibility of linguistic aspects, evaluation of effects for learning strategies, evaluation of visual aspects, evaluation of material relevance aspects, evaluation of material organization aspects, and evaluation of evaluation aspects in the form of tests (Hidayat et al., 2022; Kurniansyah et al., 2022).

The implementation stage is a full learning experiment. At this point, it is clear that students who study with android application media have better mathematical critical thinking skills than students who do not study with android application media. One of the most significant reasons is that students' learning processes are more flexible. Students can study whenever and wherever they want. Students can also study the material thoroughly and freely select material that is considered poorly understood throughout the material's various sections. This is consistent with Kurniansyah et al. (2022) belief that interesting and interactive learning media can increase students' learning motivation.

The evaluation stage results indicate that the development of this android application medium is not only recommended for trigonometry material but also materials with a connection to trigonometry, such as calculus. This is because learning mathematics is interconnected with other subjects. If students have mastered the prerequisite material's mathematical critical

thinking skills, then mastering the next material's mathematical critical thinking skills should not be too difficult (Priatna et al., 2020; Lestari et al., 2021; Setiana and Purwoko, 2021). Furthermore, due to the dynamic development of technology in mathematics learning, the material presented must be developed in Android application media. This is consistent with the fact that, to foster meaningful learning for students, the mathematical material developed on Android application media must also be linked to the real-life experiences that students have daily (Van Den Heuvel-Panhuizen, 2003; Purwasih et al., 2020).

5. Conclusion

The process of developing android-based learning media on trigonometry material has gone through ADDIE development procedures, namely (1) Analysis, (2) Design, (3) Development, (4) Implementation, and (5) Evaluation. The developed media have been valid and practical and have gone through product testing to see their effectiveness. The validation results obtained are 87.33%, with details of material experts at 84%, media experts at 92%, and validation by mathematics teachers at 86%. Furthermore, the results of the practicality test on students of 81% indicate that the android-based learning media design has a strong response, so the learning media made are very practical to use.

The achievement of students' mathematical critical thinking skills who learn using android-based media is better than those who learn without using android-based media. The achievement of students' mathematical critical thinking skills, who received learning using android-based media and those who did not use android-based media, were both in the medium category.

Research on developing android-based learning media still needs to be improved in trigonometry material and mathematical critical thinking skills. For further study, it is expected to be able to examine further the difficulties faced by students in improving other higher-order thinking skills.

Data availability statement

The original contributions presented in the study are included in the article/supplementary material, further inquiries can be directed to the corresponding author.

Ethics statement

Ethical approval was not required for the study on human participants in accordance with the local legislation and institutional requirements. Written informed consent from the participants and/or their legal guardians/next of kin was not required in accordance with the national legislation and the institutional requirements.
